Can we use electricity to control bacteria?

***— just like the way neural functions
can be controlled using electricity...***

ELECTRICALLY INDUCED BACTERIAL MEMBRANE POTENTIAL DYNAMICS

WARWICK
THE UNIVERSITY OF WARWICK

How can we induce membrane potential?

Exogenous electrical pulse should be able to open voltage-gated ion channels.

AIM:

Elucidate the input-output relation of bacterial electrical signalling.

Membrane potential ($\Delta\psi$)

Metabolic activities

Electrical signalling

Prindle et al (2015)

Sirec et al (2019)

QUESTION:

Do proliferation capacities affect the input-output relation of electrical signaling?

An experimental setup that enables monitoring the cellular response to exogenous electrical stimuli.

Stratford, Edwards et al., unpublished

Experimental design

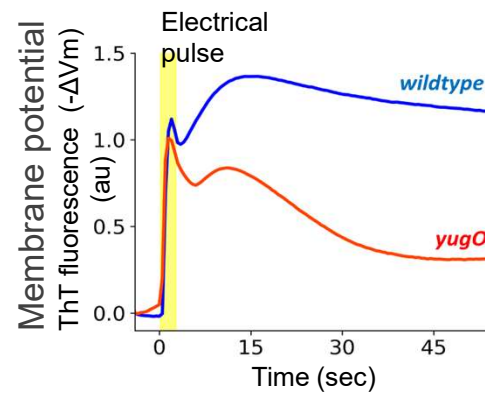

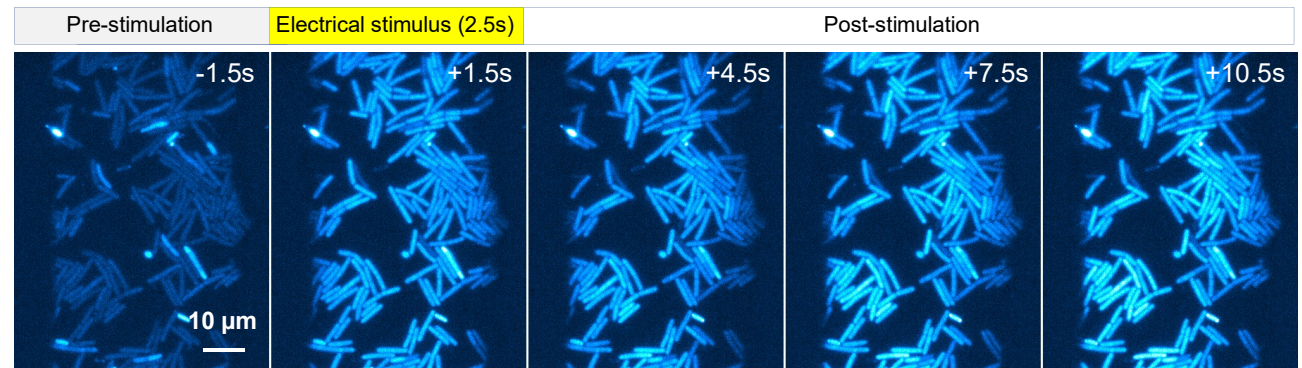

Single-cell Fluorescence
Time-lapse Microscopy

Stratford, Edwards et al., unpublished

An exogenous electrical stimulus causes hyperpolarization in bacterial cells.

UV irradiated cells depolarize to the same electrical stimulus.

Stratford, Edwards et al., unpublished

UV irradiated cells depolarize to the same electrical stimulus.

How does an identical electrical stimulus lead to responses in apparent opposite directions?

Stratford, Edwards et al., unpublished

FitzHugh-Nagumo (FHN) neuron model

Circuit diagram of the tunnel-diode nerve model of Nagumo et al. (1962).

http://www.scholarpedia.org/article/FitzHugh-Nagumo_model

FitzHugh-Nagumo (FHN) *bacteria* model

$$\frac{dV_m}{dt} = k_K((V_m + V_{m,0}) - \alpha(V_m + V_{m,0})^3 + W) + \frac{dI_v}{dt}$$

$$\frac{dW}{dt} = -((V_m + V_{m,0}) + \beta - W) + \frac{dI_w}{dt}$$

V_m : membrane potential

W : recovery variable

I : electrical stimulus

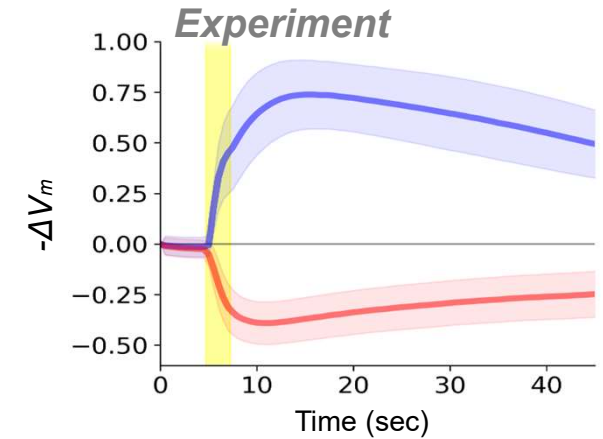

$V_{m,0}$: basal level membrane potential

k_K : degree of transmembrane
potassium gradient

Stratford, Edwards et al., unpublished

Response dynamics depends on the resting membrane potential.

Antibiotics, ethanol and CCCP all make cells respond with depolarization.

vancomycin

Stratford, Edwards et al., unpublished

How do bacteria respond to electrical signal input?

**Bacterial
cell**

Output 1

Output 2

Response dynamics to exogenous electrical stimulus as an indicator of intracellular proliferative state.

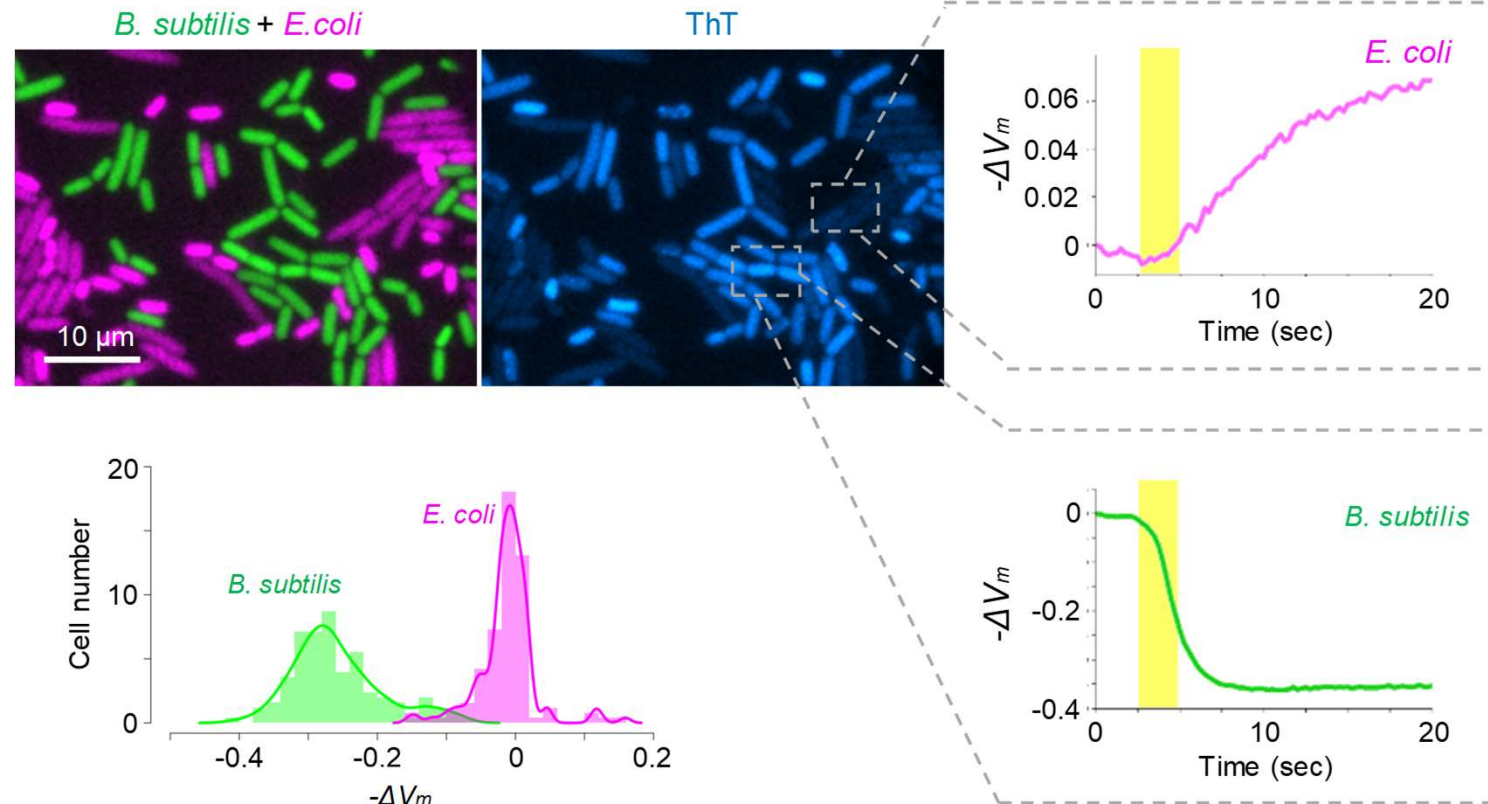

Detecting proliferative bacteria is an important task in industries as well as medical sector.

Is it possible to differentiate different species using our approach?

→ Yes! We can combine it with microbiology techniques.

Quick, easy and sensible detection system for bacteria

Innovate UK

Electrode chip for BEE

- Rapid vitality assay.
 - Biophysical investigation
 - Antibiotics susceptibility test
 - Test of new anti-bacterial treatments
- ... and more?*

- Fast
- Robust
- Easy
- Portable
