

PACT *premier*^{TM,*} HT-96

MD1-36

PACT *premier* is a pH, Anion, Cation crystallization trial devised to test pH within a PEG/Ion screen environment.

The HT kit contains 96 × 1ml reagents in a deep-well block arranged as a cation/PEG screen, an anion/PEG screen and a pH/PEG screen.

Features of PACT *premier*TM

- A modern, comprehensive PEG/ion screen
- This 96 well screen is really 3 screens:
 - 24-well pH/PEG screen
 - 24-well cation/PEG screen
 - 48-well anion/PEG screen

Rationale for a new PEG/ion screen

The first step in crystallization is often to reach for a commercially available "sparse matrix" kit, and hope that one of the conditions produces something that looks harvestable, or optimizable. If no obvious leads come out of the screen, it is hard to learn anything from the negative (precipitate and clear) results.

There are a few screens that try to test crystallization space in a more rational manner – for example, the Clear Strategy Screen and The Solubility Tool Kit.

The PEG/Ion screen (Hampton Research) is a logical test of seven cations and eleven anions using PEG 3350 as the precipitation agent. This screen has been reported by some structural genomics organizations (eg. JCSG, Syrrx) to be very successful in producing crystal hits, with the caveat that many of the hits are redundant – that is, it is not so much the combination of a given cation and anion that is successful, but that either the cation or the anion seems to dominate.

With this in mind, this PEG/ION/pH screen has been developed to systematically test the effect of pH, anions and cations, using PEG as the precipitant. This screen has been implemented very successfully at the Netherlands Cancer Institute (NKI), and at the Oxford Protein Production Facility (OXPPF).

PACT *premier*

pH/PEG screen

This consists of four broad range buffer systems (see Newman, *Acta Cryst D*, submitted) versus PEG 1500. These buffers allow one to scan the pH range from 4 to 9, without changing the chemistry of the system, so effectively isolating the effect of pH from the effect of the buffer that causes the change in pH.

Cation/PEG screen

This is made up of six cations (all with chloride counter ions) that are combined with PEG 6000 at four different pHs: Acetate pH 5 , MES pH 6 , HEPES pH 7 and Tris pH8 . The cations tested are Na⁺, NH₄⁺, Li⁺, Mg²⁺, Ca²⁺ and Zn²⁺. The zinc ion is tested at lower concentration than the other cations in the screen (0.01 M vs. 0.2 M)

Anion/PEG screen

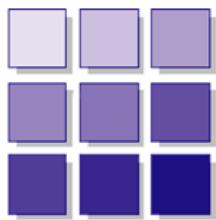

This is made up of 12 anions, with either sodium or potassium counter ions, which are tested at 0.2 M against PEG 3350. The anions include fluoride, bromine, iodide, thiocyanate, nitrate, formate, acetate, sulfate, tartrate, phosphate, citrate and malonate. The phosphate solution is tested at a concentration of 0.02 M. Chloride is not included here as it is the counter ion in the cation screen. Three sets of reagents are tested at pH 6.5, 7.5, and 8.5 with the Bis-Tris-Propane buffer system whilst one set of reagents is tested without buffering.

Formulation Notes

PACT *premier* reagents are formulated using ultrapure water (>18.0 MΩ) and are sterile-filtered using 0.22 µm filters. No preservatives are added.

Final pH may vary from that specified on the datasheet. Molecular Dimensions will be happy to discuss the precise formulation of individual reagents.

* The screen was developed by Janet Newman, and was tested in the Laboratory of Anastassis Perakis at the NKI as part of the SPINE programme, and is manufactured under license by Molecular Dimensions Ltd.

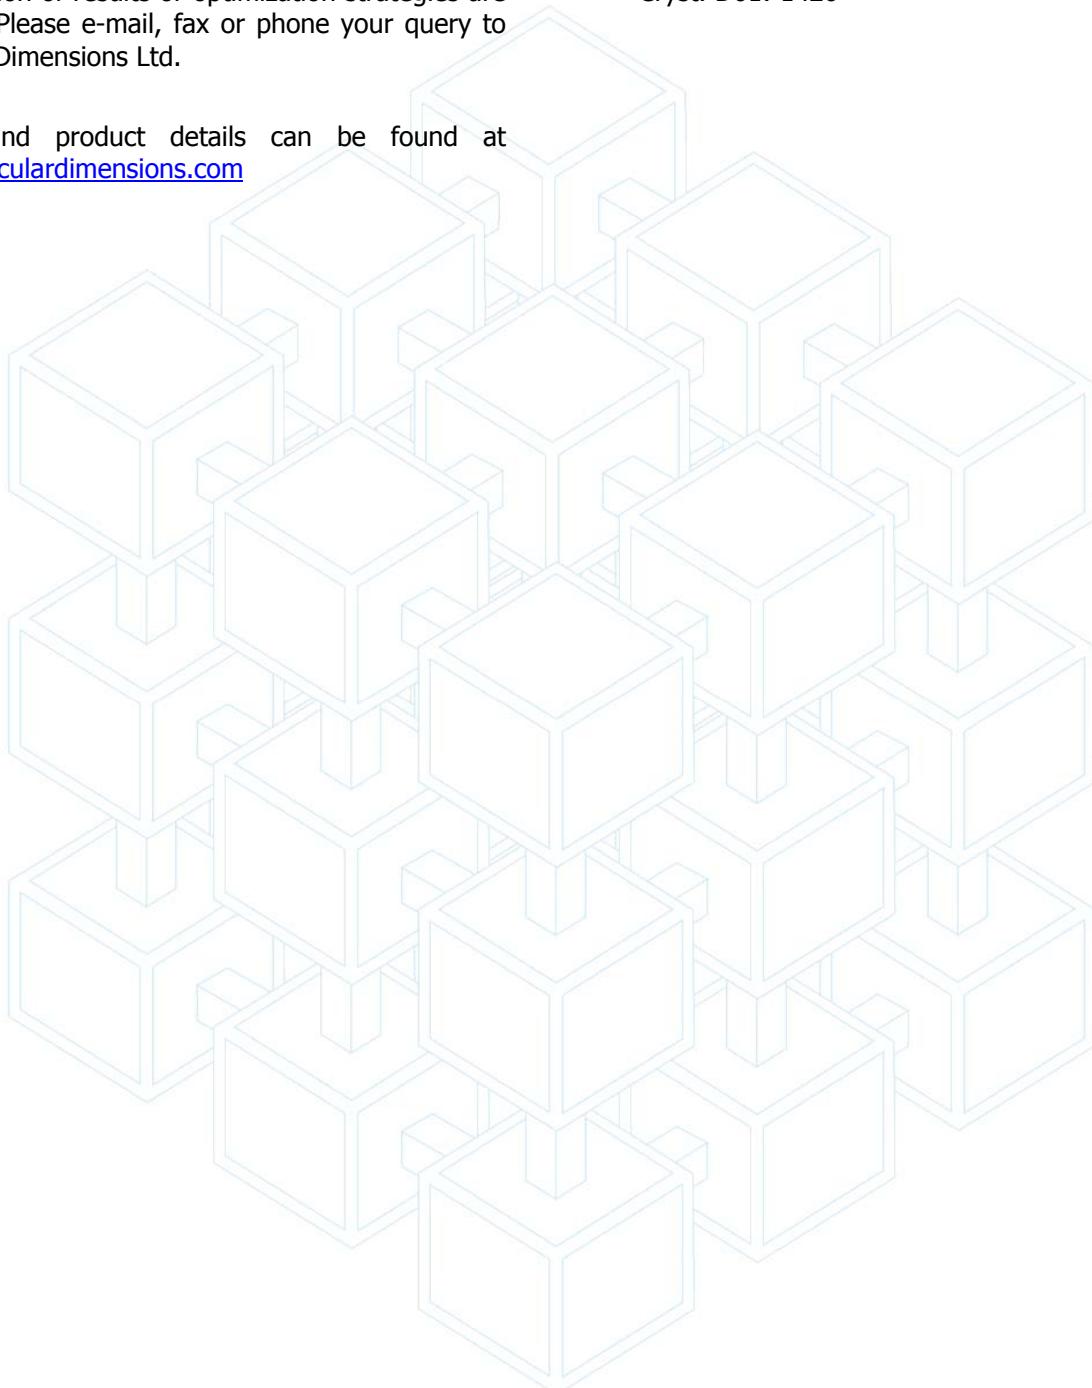

Individual reagents and stock solutions for optimization are available from Molecular Dimensions.

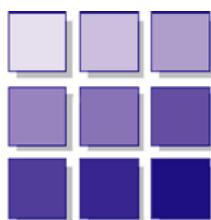

Enquiries regarding PACT *premier* formulation, interpretation of results or optimization strategies are welcome. Please e-mail, fax or phone your query to Molecular Dimensions Ltd.

**To set-up a screen**

Take a 96 well plate and divide up into a 24 well pH/PEG screen, a 24 well PEG/cation screen and a 48 well PEG/anion screen as shown in Figure 1. Note: Each subscreen uses a different PEG.

Figure 1
