Forward model

$$\frac{dx}{dt} = f(t, x, \theta), \quad x(0) = x_0, \tag{1}$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

• $x = x(t) \in \mathbb{R}^n$ is the state vector,

- $\theta \in \mathbb{R}^k$ is the unknown, or poorly known *parameter vector*,
- $f : \mathbb{R} \times \mathbb{R}^n \times \mathbb{R}^k \to \mathbb{R}^n$ is the model function
- ► x₀ possibly unknown, or poorly unknown *initial value*.

Data: discrete noisy observations, may depend on the parameter vector:

$$b_j = g(x(t_j), \theta) + n_j, \quad t_1 < t_2 < \dots,$$
 (2)

• $g: \mathbb{R}^n \times \mathbb{R}^k \to \mathbb{R}$ is the observation function

n_i is the observation noise

The inverse problem: Estimate the state vector and the parameter vector, $(x(t), \theta)$, based on the observations.

Two motivational problem

The dynamical system of acetate metabolism in brain by PET scan data:

$$\frac{dm_1}{dt}(t) = K_1c(t) - (k_2 + k_3)m_1(t)$$
$$\frac{dm_2}{dt}(t) = k_3m_1(t) - k_5m_2(t)$$

Observation: Noisy measurements of

$$c(t_j), \quad m(t_j) = V_0 c(t_j) + m_1(t_j) + m_2(t_j).$$

The discrete time Markov models framework

Evolution model:

$$X_{j+1} = F(X_j, \theta) + V_{j+1},$$

- F is a known propagation model
- V_{j+1} is an innovation process

 \blacktriangleright θ is a parameter: assumed known now, later to be estimated. The observation model

$$Y_j = G(X_j) + W_j,$$

the observation noise W_j independent of X_j . Update scheme for posterior densities given accumulated data:

$$\pi(x_j \mid D_j) \longrightarrow \pi(x_{j+1} \mid D_j) \longrightarrow \pi(x_{j+1} \mid D_{j+1})$$

Bayesian filtering

1. Propagation step: Chapman-Kolmogorov formula

$$\begin{aligned} \pi(x_{j+1} \mid D_j) &= \int \pi(x_{j+1} \mid x_j, D_j) \pi(x_j \mid D_j) dx_j \\ &= \int \pi(x_{j+1} \mid x_j) \pi(x_j \mid D_j) dx_j, \end{aligned}$$

2. Analysis step: Bayes' formula conditional on D_j

$$\begin{aligned} \pi(x_{j+1} \mid D_{j+1}) &= & \pi(x_{j+1} \mid y_{j+1}, D_j) \\ &\propto & \pi(y_{j+1} \mid x_{j+1}, D_j) \pi(x_{j+1} \mid D_j) \\ &= & \pi(y_{j+1} \mid x_{j+1}) \pi(x_{j+1} \mid D_j), \end{aligned}$$

Combining:

$$\pi(x_{j+1} \mid D_{j+1}) \propto \pi(y_{j+1} \mid x_{j+1}) \int \pi(x_{j+1} \mid x_j) \pi(x_j \mid D_j) dx_j.$$

Bayesian filtering

Assume that the current distribution is represented in terms of a sample

$$\mathscr{S}_{j} = \left\{ (x_{j}^{1}, w_{j}^{1}), (x_{j}^{2}, w_{j}^{2}), \dots, (x_{j}^{N}, w_{j}^{N}) \right\}.$$

The particle version (Monte Carlo integration):

$$\pi(x_{j+1} \mid D_{j+1}) \propto \pi(y_{j+1} \mid x_{j+1}) \int \pi(x_{j+1} \mid x_j) \pi(x_j \mid D_j) dx_j$$

is approximated by

$$\pi(x_{j+1} \mid D_{j+1}) \propto \pi(y_{j+1} \mid x_{j+1}) \sum_{n=1}^{N} w_j^n \pi(x_{j+1} \mid x_j^n).$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Example: Gaussian innovation and noise

Assuming the propagation model

$$X_{j+1} = F(X_j) + V_{j+1}, \quad V_{j+1} \sim \mathcal{N}(0, \Gamma_{j+1}),$$

we have

$$\pi(x_{j+1} \mid x_j) \propto \exp\left(-\frac{1}{2}(x_{j+1} - F(x_j))^{\mathsf{T}} \Gamma_{j+1}^{-1}(x_{j+1} - F(x_j))\right),$$

Similarly, the observation model

$$Y_j = G(X_j) + W_j, \quad W_j \sim \mathscr{N}(0, \Sigma_j)$$

gives the likelihood

$$\pi(y_j \mid x_j) \propto \exp\left(-\frac{1}{2}(y_j - G(x_j))^\mathsf{T} \Sigma_j^{-1}(y_j - G(x_j))
ight).$$

Sampling Importance Resampling (SIR)

Layered sampling: For $n = 1, 2, \ldots, N$,

- 1. Draw a candidate particle \tilde{x}_{j+1}^n from $\pi(x_{j+1} \mid x_j^n)$;
- 2. Compute the relative likelihood $g_{i+1}^n = \pi(y_{i+1} \mid \tilde{x}_{i+1}^n)$;
- 3. Resample with replacement from

$$\big\{\big(\widetilde{x}_{j+1}^1,\widetilde{w}_{j+1}^1\big),\big(\widetilde{x}_{j+1}^2,\widetilde{w}_{j+1}^2\big),\ldots,\big(\widetilde{x}_{j+1}^N,\widetilde{w}_{j+1}^N\big)\big\},$$

where the probability weights are defined as

$$\widetilde{w}_{j+1}^n = rac{\mathcal{g}_{j+1}^n}{\sum \mathcal{g}_{j+1}^n}$$

Sampling Importance Resampling (SIR)

Data thinning:

- Most particles \tilde{x}_{i+1}^n may have vanishingly small likelihood.
- Few candidate particles are sampled over and over: The new sample consists mostly copies of few candidate particles.

• The density is poorly sampled.

Improvement: Auxiliary particles

Before resampling, calculate an auxiliary predictor:

$$\overline{x}_{j+1}^n = F(x_j^n).$$

We write

$$\pi(x_{j+1} \mid D_{j+1}) \propto \sum_{n=1}^{N} \underbrace{w_{j}^{n} \pi(y_{j+1} \mid \overline{x}_{j+1}^{n})}_{=g_{j+1}^{n}} \frac{\pi(y_{j+1} \mid x_{j+1})}{\pi(y_{j+1} \mid \overline{x}_{j+1}^{n})} \pi(x_{j+1} \mid x_{j}^{n}),$$

The quantity g_{j+1}^n is a *predictor* of how well the auxiliary particle would explain the data.

Survival of the Fittest (SOF)

Set i =

Given the initial probability density $\pi_0(x_0)$,

1. *Initialization:* Draw the particle ensemble from $\pi_0(x_0)$:

$$S_0 = \left\{ (x_0^1, w_0^1), (x_0^2, w_0^2), \dots, (x_0^N, w_0^N) \right\}$$
$$w_0^1 = w_0^2 = \dots = w_0^N = \frac{1}{N}.$$
0.

,

2. Propagation: Compute the predictor:

$$\overline{x}_{j+1}^n = F(x_j^n), \quad 1 \le n \le N.$$

Survival of the Fittest (SOF)

3. Survival of the fittest: For each n:(a) Compute the fitness weights

$$g_{j+1}^n = w_j^n \pi(y_{j+1} \mid \overline{x}_{j+1}^n), \quad g_{j+1}^n \leftarrow \frac{g_{j+1}^n}{\sum_n g_{j+1}^n};$$

(b) Draw indices with replacement ℓ_n ∈ {1, 2, ..., N} using probabilities P{ℓ_n = k} = g^k_{j+1};
(c) Reshuffle

$$x_j^n \leftarrow x_j^{\ell_n}, \quad \overline{x}_{j+1}^n \leftarrow \overline{x}_{j+1}^{\ell_n}, \quad 1 \le n \le N.$$

Survival of the Fittest (SOF)

4. Innovation: For each n: Proliferate

$$x_{j+1}^n = \overline{x}_{j+1}^n + v_{j+1}^n.$$

5. Weight updating: For each n, compute

$$w_{j+1}^n = rac{\pi(y_{j+1} \mid x_{j+1}^n)}{\pi(y_{j+1} \mid \overline{x}_{j+1}^n)}, \quad w_{j+1}^n \leftarrow rac{w_{j+1}^n}{\sum_n w_{j+1}^n}.$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

6. If j < T, increase $j \leftarrow j + 1$ and repeat.

Estimating parameters: Sequential Monte Carlo

For the discrete time model, the propagation (and possibly the likelihood) may depend on the unknown θ ,

$$x_{j+1}=F(x_j,\theta).$$

Monte Carlo integral for posterior update:

$$egin{aligned} \pi(x_{j+1}, heta \mid D_{j+1}) &\propto \pi(y_{j+1} \mid x_{j+1}, heta) \ & imes \int \pi(x_{j+1} \mid x_j, heta) \pi(x_j \mid heta, D_j) \pi(heta \mid D_j) dx_j, \end{aligned}$$

Sample update:

$$\mathscr{S}_{j} \to \mathscr{S}_{j+1}, \quad \mathscr{S}_{j} = \left\{ (x_{j}^{n}, \theta_{j}^{n}, w_{j}^{n}) \right\}_{n=1}^{N}.$$

where \mathscr{S}_j is drawn from $\pi(x_j, \theta \mid D_j)$.

Auxiliary parameter particles

Given the current parameter sample,

$$(\theta_j^1, w_j^1), (\theta_j^2, w_j^2), \ldots, (\theta_j^N, w_j^N),$$

estimate the mean and covariance,

$$\overline{\theta}_j = \sum_{n=1}^N w_j^n \theta_j^n, \qquad \mathsf{C}_j = \sum_{n=1}^N w_j^n \big(\theta_j^n - \overline{\theta}_j\big) \big(\theta_j^n - \overline{\theta}_j\big)^\mathsf{T}.$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Auxiliary parameter particles

Approximate the marginal probability density $\pi(\theta \mid D_j)$ of θ by a Gaussian mixture model,

$$\pi(\boldsymbol{\theta} \mid D_j) \approx \sum_{n=1}^{N} w_j^n \mathcal{N}(\boldsymbol{\theta} \mid \overline{\boldsymbol{\theta}}_j^n, s^2 C_j),$$

for which we define the auxiliary particle by

$$\overline{ heta}_{j}^{n}= extbf{a} heta_{j}^{n}+(1- extbf{a})\overline{ heta}_{j},$$

where a is a shrinkage factor, 0 < a < 1 and $a^2 + s^2 = 1$ to avoid artificial diffusion.

Auxiliary parameter particles

Left as an exercise:

$$\mathsf{E}\left\{\sum_{n=1}^{N}w_{j}^{n}\mathscr{N}\left(\theta\mid\overline{\theta}_{j}^{n},s^{2}\mathsf{C}_{j}\right)\right\}=\overline{\theta}_{j},$$

and

$$\operatorname{cov}\left\{\sum_{n=1}^{N} w_{j}^{n} \mathscr{N}\left(\theta \mid \overline{\theta}_{j}^{n}, s^{2} \mathsf{C}_{j}\right)\right\} = \mathsf{C}_{j},$$

Auxiliary parameter particles Approximate

$$\pi(x_{j+1}, \theta \mid D_{j+1})$$

$$\propto \sum_{n=1}^{N} w_j^n \pi(y_{j+1} \mid x_{j+1}, \theta) \pi(x_{j+1} \mid x_j^n, \theta) \mathcal{N}(\theta \mid \overline{\theta}_j^n, s^2 \mathsf{C}_j),$$

which we write as

$$\pi(x_{j+1}, \theta \mid D_{j+1}) \propto \sum_{n=1}^{N} \underbrace{w_j^n \pi(y_{j+1} \mid \overline{x}_{j+1}^n, \overline{\theta}_j^n)}_{=g_{j+1}^n} \times \frac{\pi(y_{j+1} \mid x_{j+1}, \theta)}{\pi(y_{j+1} \mid \overline{x}_{j+1}^n, \overline{\theta}_j^n)} \pi(x_{j+1} \mid x_j^n, \theta) \mathcal{N}(\theta \mid \overline{\theta}_j^n, s^2 C_j),$$

where the coefficient g_{i+1}^n is the fitness of the predictor

$$\left(\overline{x}_{j+1}^{n},\overline{\theta}_{j}^{n}\right)=\left(F(x_{j+1}^{n},\overline{\theta}_{j}^{n}),\overline{\theta}_{j}^{n}\right).$$

1. Initialization: Draw the particle ensemble from $\pi_0(x_0, \theta)$:

$$S_0 = \{ (x_0^1, \theta_0^1, w_0^1), (x_0^2, \theta_0^2, w_0^2), \dots, (x_0^N, \theta_0^N, w_0^N) \}, \\ w_0^1 = w_0^2 = \dots = w_0^N = \frac{1}{N}.$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 = のへで

Compute the parameter mean and covariance:

$$\overline{\theta}_0 = \sum_{n=1}^N w_0^n \theta_0^n, \quad \mathsf{C}_0 = \sum_{n=1}^N w_0^n \big(\theta_0^n - \overline{\theta}_0 \big) \big(\theta_0^n - \overline{\theta}_0 \big)^\mathsf{T}.$$

Set j = 0.

2. Propagation: Shrink the parameters

$$\overline{ heta}_{j}^{n}=a heta_{j}^{n}+(1-a)\overline{ heta}_{j},\quad 1\leq n\leq N,$$

by a factor 0 < a < 1. Compute the state predictor:

$$\overline{x}_{j+1}^n = F(x_j^n, \overline{\theta}_j^n), \quad 1 \le n \le N.$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

3. Survival of the fittest: For each n:

(a) Compute the fitness weights

$$g_{j+1}^n = w_j^n \pi(y_{j+1} \mid \overline{x}_{j+1}^n, \overline{\theta}_j^n), \quad g_{j+1}^n \leftarrow \frac{g_{j+1}^n}{\sum_n g_{j+1}^n};$$

n

(b) Draw indices with replacement ℓ_n ∈ {1, 2, ..., N} using probabilities P{ℓ_n = k} = g^k_{j+1};
(c) Reshuffle

$$(\overline{x}_{j+1}^n, \overline{\theta}_j^n) \leftarrow (\overline{x}_{j+1}^{\ell_n}, \overline{\theta}_j^{\ell_n}), \quad \overline{x}_{j+1}^n \leftarrow \overline{x}_{j+1}^{\ell_n}, \quad 1 \le n \le N.$$

4. Proliferation: For each n:

(a) Proliferate the parameter by drawing

$$heta_{j+1}^n \sim \mathcal{N}ig(\overline{ heta}_j^n, s^2 \mathsf{C}_jig), \quad s^2 = 1 - a^2;$$

(b) Repropagate and add innovation:

$$x_{j+1}^n = F(x_j^n, \theta_{j+1}^n) + v_{j+1}^n.$$

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

5. Weight updating: For each n, compute

$$w_{j+1}^{n} = \frac{\pi(y_{j+1} \mid x_{j+1}^{n}, \theta_{j+1}^{n})}{\pi(y_{j+1} \mid \overline{x}_{j+1}^{n}, \overline{\theta}_{j}^{n})}, \quad w_{j+1}^{n} \leftarrow \frac{w_{j+1}^{n}}{\sum_{n} w_{j+1}^{n}}.$$

6. If j < T, update

$$\overline{\theta}_{j+1} = \sum_{n=1}^{N} w_{j+1}^n \theta_{j+1}^n, \quad \mathsf{C}_{j+1} = \sum_{n=1}^{N} w_{j+1}^n \big(\theta_{j+1}^n - \overline{\theta}_{j+1} \big) \big(\theta_{j+1}^n - \overline{\theta}_{j+1} \big)^\mathsf{T},$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

increase $j \leftarrow j + 1$ and repeat.

Propagation and innovation

The problem we are addressing assumes

$$\frac{dx}{dt} = f(t, x, \theta), \quad x(0) = x_0,$$

while the discrete propagation is written as

$$x_{j+1} = F(x_j, \theta) + v_{j+1}.$$

Questions:

- 1. How do we propagate?
- 2. What is the innovation?

Propagation and innovation

Naive propagation scheme

$$x_{j+1} \approx x_j + \Delta t F(x_j, \theta),$$

which is used for SDE schemes (Euler-Maruyama) has several problems:

- The systems are typically stiff, leading to prohibitively small step size to guarantee stability
- The innovation needs to be related to approximation error.

A more sophisticated solution: Use a standard stiff solver such as ode15s.

Error proportional to approximation accuracy.

Problem:

Variable time step: some particles require longer integaration

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

• The slowest particle determines the propagation speed.

Histogram of propagation times: An example

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ ○臣 - の々ぐ

Stiffness and syncronization

For systems which are inherently stiff, we use a good stiff solver:

$$x_{j+1} = F^{\text{exact}}(x_j, \theta) = F(x_j, \theta) + \text{approximation error},$$

where the approximation error is due to numerical integration. If the stiffness of the systems varies a lot with the parameter values prescribing a fixed accuracy may be a problems because

- The time for the particles propagation may vary widely;
- The slowest particle determines the propagation speed
- We cannot take full advantage of parallel and vectorized computing environment.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Linear Multistep Methods

Given r past values,

$$u_n, u_{n+1}, \ldots, u_{n+r-1},$$

write

$$\sum_{j=0}^{r} \alpha_j u_{n+j} = h \sum_{j=0}^{r} \beta_j f(u_{n+j}, t_{n+j}),$$

and determine the coefficients α_j , β_j from a condition that the formula is accurate for a polynomial.

Adams methods: $\alpha_r = 1$, $\alpha_{r-1} = -1$, $\alpha_j = 0$ for j < r - 1.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Higher Order Method Error Control (HOMEC)

- ► u_{n+r} = candidate solution at time t_{n+r} computed by the LMM of order p,
- \hat{u}_{n+r} = solution at t_{n+r} given by the higher order method.
- $u = \text{exact solution with initial value } u(t_n) = u_n$

$$u_{n+r} = u(t_{n+r}) + \ell h^{p+1} + \mathcal{O}(h^{p+2})$$

$$\hat{u}_{n+r} = u(t_{n+r}) + \mathcal{O}(h^{p+2})$$

as $h \rightarrow 0$, where ℓ is some vector depending on the solution u(t) of the ODE system but not on h.

Subtracting and neglecting higher order terms:

$$\ell h^{p+1} \approx u_{n+r} - \widehat{u}_{n+r}$$

Prescribe time, not accuracy

Thus, to improve the performance of the algorithm we

- Propagate each particle with fixed propagation time.
- Estimate the numerical accuracy for each particle
- Set the *j*th particle innovation variance proportional to the integration error.

This yields the innovation covariance matrix

 $V_{j+1} \sim \mathcal{N}(0, \Gamma_{j+1}),$

where for $1 \leq i \leq d$,

$$\Gamma_{j+1} = \operatorname{diag}(\gamma) + \varepsilon I, \quad \gamma_i = \tau^2 (u_{j+1} - \widehat{u}_{j+1})_i^2,$$

with $\tau > 1$.

SOF with error estimate innovation

Set i =

Given the initial probability density $\pi_0(x_0)$,

1. *Initialization:* Draw the particle ensemble from $\pi_0(x_0)$:

$$S_0 = \left\{ (x_0^1, w_0^1), (x_0^2, w_0^2), \dots, (x_0^N, w_0^N) \right\}$$
$$w_0^1 = w_0^2 = \dots = w_0^N = \frac{1}{N}.$$
$$0.$$

,

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

2. Propagation: Compute the predictor using LMM:

$$\overline{x}_{j+1}^n = \Psi(x_j^n, h), \quad 1 \le n \le N.$$

3. Survival of the fittest: For each n:(a) Compute the fitness weights

$$g_{j+1}^n = w_j^n \pi(y_{j+1} \mid \overline{x}_{j+1}^n), \quad g_{j+1}^n \leftarrow \frac{g_{j+1}^n}{\sum_n g_{j+1}^n};$$

(b) Draw indices with replacement ℓ_n ∈ {1, 2, ..., N} using probabilities P{ℓ_n = k} = g^k_{j+1};
(c) Reshuffle

$$x_j^n \leftarrow x_j^{\ell_n}, \quad \overline{x}_{j+1}^n \leftarrow \overline{x}_{j+1}^{\ell_n}, \quad 1 \le n \le N.$$

- 4. Innovation: For each n:
 - (a) Using error estimate, estimate $\Gamma_{j+1}^n = \Gamma_{j+1}(x_j^n)$;
 - (b) Draw $v_{i+1}^n \sim \mathcal{N}(0, \Gamma_{i+1}^n)$;

(c) Proliferate

$$x_{j+1}^n = \overline{x}_{j+1}^n + v_{j+1}^n.$$

5. Weight updating: For each n, compute

$$w_{j+1}^{n} = \frac{\pi(y_{j+1} \mid x_{j+1}^{n})}{\pi(y_{j+1} \mid \overline{x}_{j+1}^{n})}, \quad w_{j+1}^{n} \leftarrow \frac{w_{j+1}^{n}}{\sum_{n} w_{j+1}^{n}}$$

6. If j < T, increase $j \leftarrow j + 1$ and repeat from (ii).

The parameter estimation SMC can be also carried out concurrently.

Extensions to EnKF

Assuming that the current density $\pi(x_j, \theta \mid D_j)$ is represented in terms of an ensemble

$$\mathscr{S}_{j|j} = \left\{ \left(x_{j|j}^1, \theta_j^1 \right), \left(x_{j|j}^2, \theta_j^2 \right), \dots, \left(x_{j|j}^N, \theta_j^N \right) \right\},\$$

the state prediction ensemble is obtained by

$$x_{j+1|j}^n = F\left(x_{j|j}^n, heta_j^n
ight) + v_{j+1}^n, n = 1, 2, \dots, N$$

following the state evolution equation and setting the innovation variance as for the particle filter.

Assume a linear observation model.

Combining state and parameter vectors

Compute the prediction ensemble statistics by defining the state and parameter vectors

$$z_{j+1|j}^n = \begin{bmatrix} x_{j+1|j}^n \\ \theta_j^n \end{bmatrix}, \qquad n=1,2,\ldots,N.$$

The prediction ensemble mean is

$$\overline{z}_{j+1|j} = \frac{1}{N} \sum_{n=1}^{N} z_{j+1|j}^{n}$$

and the prior covariance matrix is

$$\Gamma_{j+1|j} = \frac{1}{N-1} \sum_{n=1}^{N} \left(z_{j+1|j}^{n} - \overline{z}_{j+1|j}^{n} \right) \left(z_{j+1|j}^{n} - \overline{z}_{j+1|j}^{n} \right)^{\mathsf{T}}$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

When an observation y_{j+1} arrives, an observation ensemble is generated by parametric bootstrapping

$$y_{j+1}^n = y_{j+1} + w_{j+1}^n$$

where $w_{j+1}^n \sim \mathcal{N}(0, D)$ is a realization of the noise. In the case of a linear observation the combined posterior ensemble is obtained as

$$z_{j+1|j+1}^n = z_{j+1|j}^n + K_{j+1} \left(y_{j+1}^n - G_{j+1} z_{j+1|j}^n \right), \qquad n = 1, 2, \dots, N$$

where the Kalman gain K_{j+1} is

$$\mathsf{K}_{j+1} = \mathsf{\Gamma}_{j+1|j}\mathsf{G}_{j+1}^{\mathsf{T}} \left(\mathsf{G}_{j+1}\mathsf{\Gamma}_{j+1|j}\mathsf{G}_{j+1}^{\mathsf{T}} + D\right)^{-1}$$

The posterior means and covariances for the states and parameters are computed using the posterior ensemble statistics.

A simple example motivated by acetate metabolism

$$\frac{dx_1}{dt} = \Phi(t) - V_1 \frac{x_1}{x_1 + k_1}$$

$$\frac{dx_2}{dt} = V_1 \frac{x_1}{x_1 + k_1} - V_2 \frac{x_2}{x_2 + k_2}$$

$$\frac{dx_3}{dt} = V_2 \frac{x_2}{x_2 + k_2} - \lambda(x_3 - c_0)$$

- Evolution model: nonlinear system of ODEs;
- ▶ Number of unknown parameters: 44+52.
- The stiffness of the underlying ODE system reflects the difference in time constants of the different reactions and transports.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Numerical test

- Data: Noisy measurements of 8 concentrations in blood at 11 time instances.
- Propagation: use implicit time integrators BDF2 (and BDF3) with fixed time step h = 0.01 or 0.6 seconds.
- ► Ensemble size: N=250.
- Fix 44 parameters corresponding to facilitators and estimate remaining 52 (max flux and affinity)
- Initial ensemble: cloud of parameters values not centered around true values and corresponding initial values which support steady state.
- At each time step we inflate the covariance matrix by 20%.

Spatio-temporal prior

- We want to favor solutions with moderate rates of change.
- Exponential a priori bound:

$$M^{-\Delta t_{j+1}}\overline{C}(t_j) \leq C(t_{j+1}) \leq M^{\Delta t_{j+1}}\overline{C}(t_j)$$

for M > 1 and $\Delta t_{j+1} = t_{j+1} - t_j$, which implies

$$\|\log \left(rac{\mathcal{C}(t_{j+1})}{\overline{\mathcal{C}}(t_j)}
ight)\| = |x(t_{j+1}) - \overline{x}_{j|j}| \leq (\log M)\Delta t_{j+1}.$$

We set

$$x(t_{j+1}) \sim \mathcal{N}(\overline{x}_{j|j}, \gamma^2 (\Delta t_{j+1})^2 I_d)$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

with M = 20 and $\gamma = \log M/2$.
