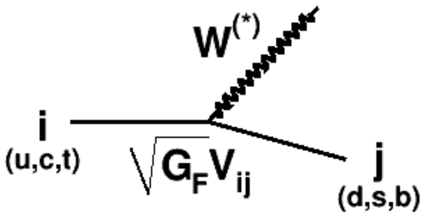
  - Rare decays
- Future prospects

Outline

- Why quark flavour physics in the LHC era?
- Selected highlights of recent results
  - Production and spectroscopy
  - CP violation and the Unitarity Triangle
  - Rare decays
- Future prospects

Sincere apologies for many omitted topics including many results from many experiments with strong UK involvement

Quark flavour mixing
a.k.a. CKM phenomenology

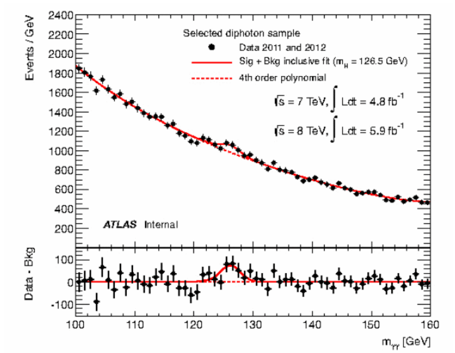


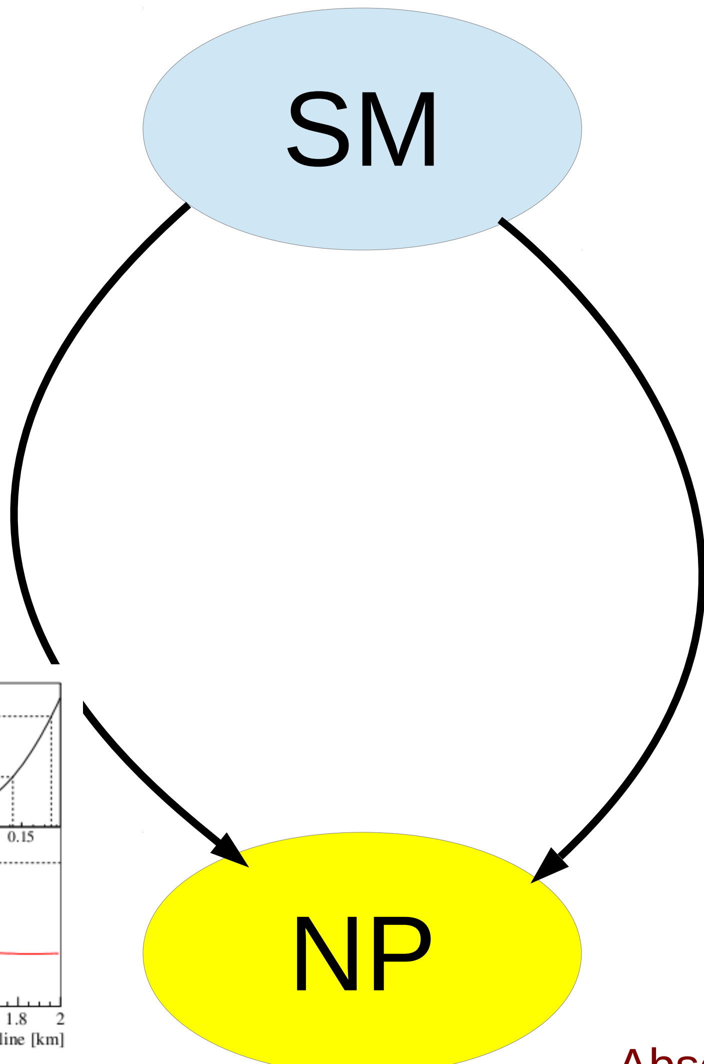
$$V_{CKM} = \begin{pmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{td} & V_{ts} & V_{tb} \end{pmatrix} = \begin{pmatrix} 1-\frac{1}{2}\lambda^2 & \lambda & A\lambda^3(\rho - i\eta) \\ -\lambda & 1-\frac{1}{2}\lambda^2 & A\lambda^2 \\ A\lambda^3(1-\rho-i\eta) & -A\lambda^2 & 1 \end{pmatrix} + O(\lambda^4)$$

- CKM theory is highly predictive
  - huge range of phenomena over a massive energy scale predicted by only 4 independent parameters
- CKM matrix is hierarchical
  - theorised connections to quark mass hierarchies, or (dis-)similar patterns in the lepton sector
    - origin of CKM matrix from diagonalisation of Yukuwa (mass) matrices after electroweak symmetry breaking
  - distinctive flavour sector of Standard Model not necessarily replicated in extended theories → strong constraints on models
- CKM mechanism introduces CP violation
  - only source of CP violation in the Standard Model ($m_\nu = \theta_{QCD} = 0$)

Two routes to heaven

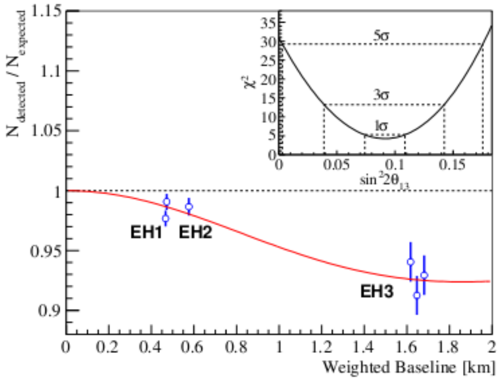
for quark flavour physics





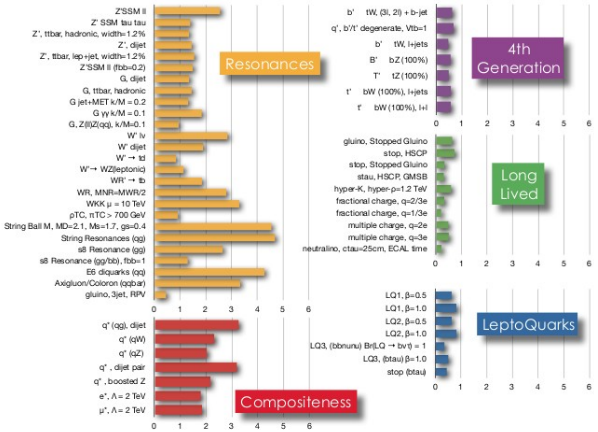
CP violation
(extra sources must exist)

But
- No guarantee of the scale
- No guarantee of effects in the quark sector
- Realistic prospects for CPV measurement in νs due to large θ_{13}



Rare decays
(strong theoretical arguments)

But
- How high is the NP scale?
- Why have FCNC effects not been seen?



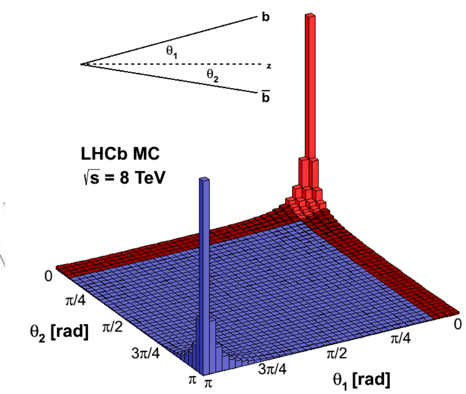
Absence of NP signals at ATLAS/CMS → argument for searches via rare decays stronger

Why quark flavour physics in the LHC era?

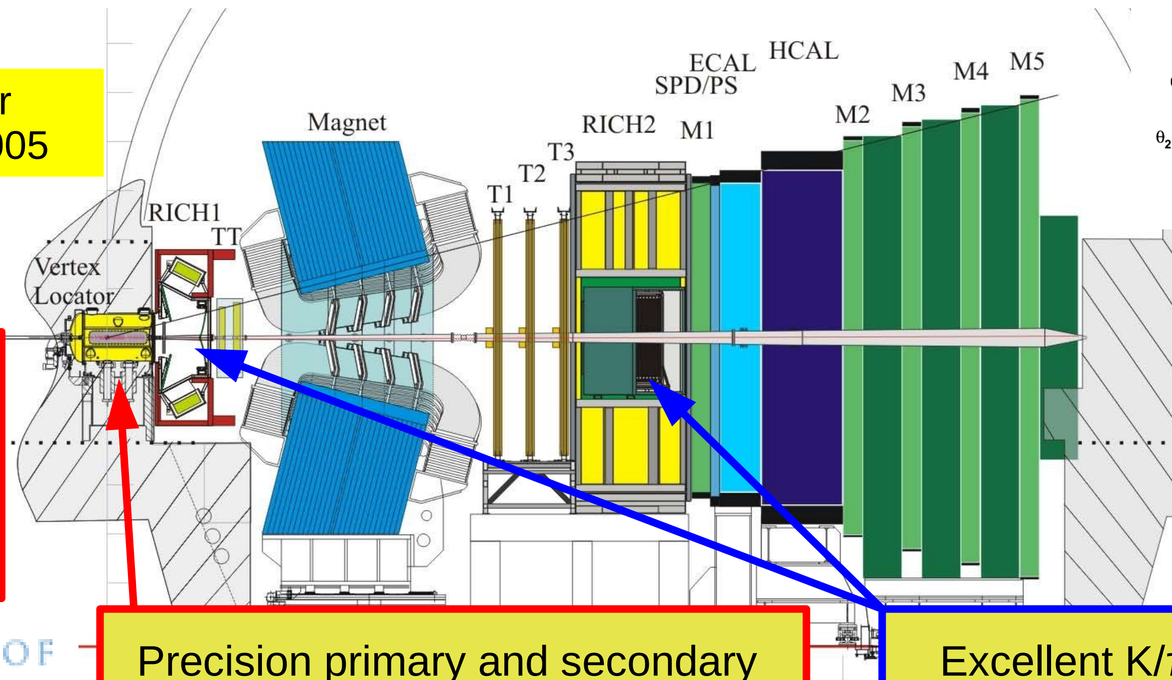
- There is still much physics to be done with the datasets of BaBar, Belle, CDF, D0, CLEO, BES, etc.
  - Discovery potential complementary to other experiments → serious issues re: data preservation
- The LHC is the world's most copious source of heavy flavoured quarks
  - Exploit the capability of ATLAS and CMS
  - LHCb experiment dedicated to b & c physics (forward region)
  - Allows LHC programme to explore *beyond* the energy frontier
- In addition to studying flavour-changing phenomena, excellent opportunities to study unresolved issues in QCD
  - Puzzles concerning heavy flavour production and spectroscopy

The LHCb detector

- In high energy collisions, $b\bar{b}$ pairs produced predominantly in forward or backward directions
- LHCb is a forward spectrometer
  - a new concept for HEP experiments



The LHCb Detector
JINST 3 (2008) S08005



Precision primary and secondary vertex measurements

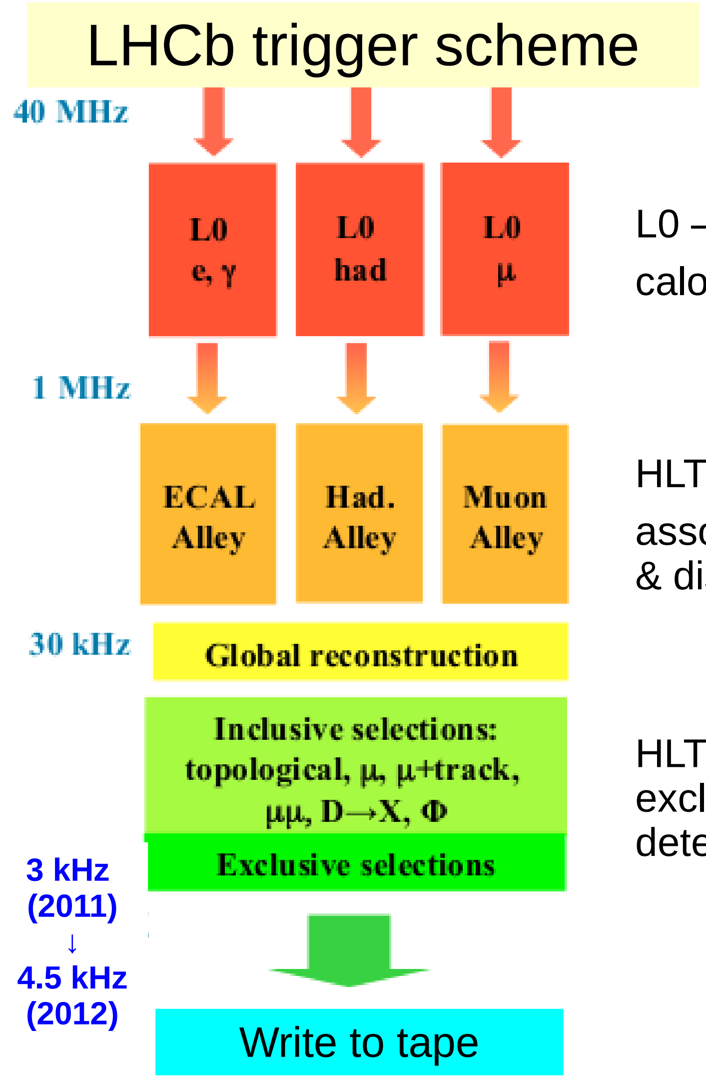
Excellent K/π separation capability

The LHCb trigger

Challenge is
- to efficiently select most interesting B decays
- while maintaining manageable data rates

Main backgrounds
- "minimum bias" inelastic pp scattering
- other charm and beauty decays

Handles
- high p_T signals (muons)
- displaced vertices



The LHCb trigger and its performance arXiv:1211.3055

L0 – high p_T signals in calorimeters & muon chambers

HLT1 – find high p_T tracks; associate L0 signals with tracks & displaced vertices

HLT2 – inclusive signatures + exclusive selections using full detector information

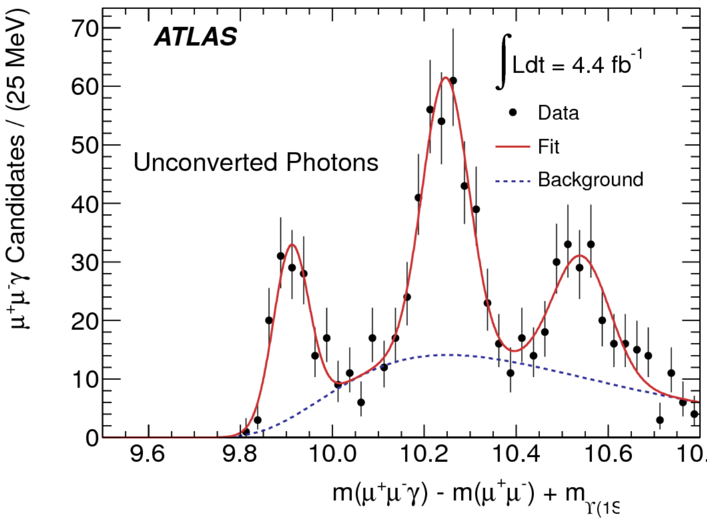
Selected highlights of results
Production and spectroscopy

Observations of new states

(no, not the Higgs)

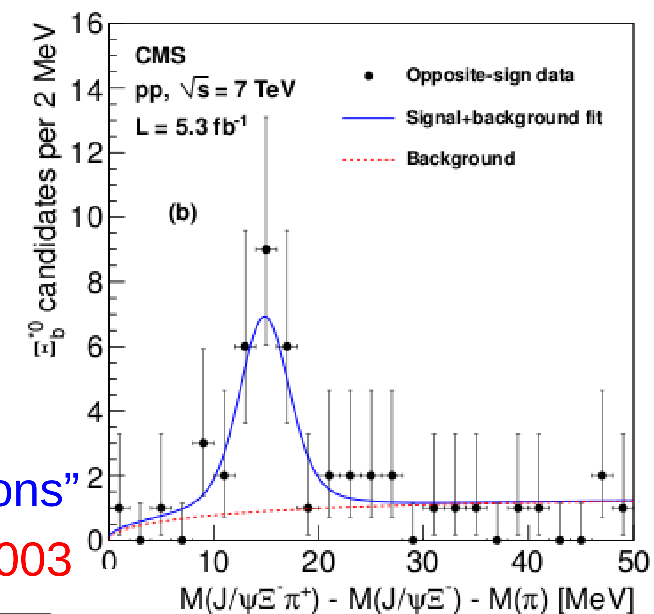
"Observation of a New χ_b State in Radiative Transitions to Υ(1S) and Υ(2S) at ATLAS"

Phys. Rev. Lett. 108 (2012) 152001



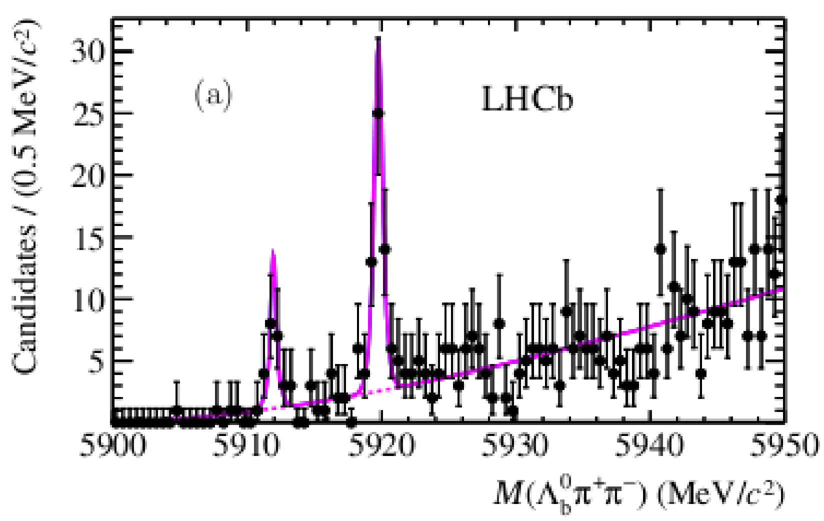
"Observation of a New Ξ_b Baryon"

Phys. Rev. Lett. 108 (2012) 252002



"Observation of excited Λ^0_b baryons"

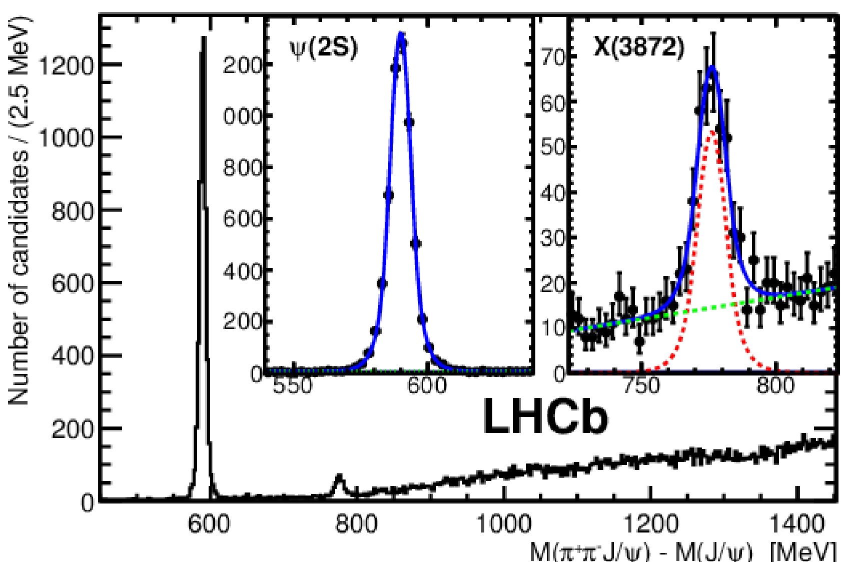
Phys. Rev. Lett. 109 (2012) 172003

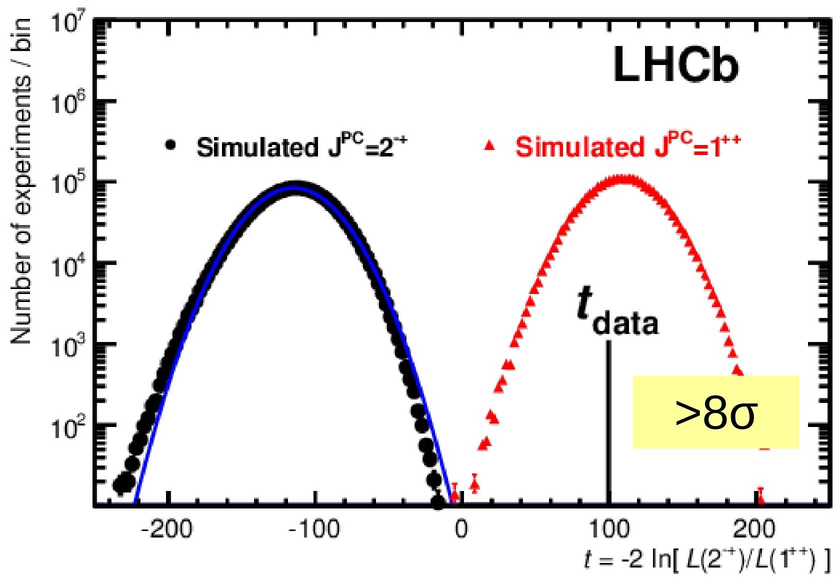


Unconventional states (I) X(3872)

LHCb-PAPER-2013-001
arXiv:1302.6269

- X(3872) discovered by Belle decaying to J/ψππ (PRL 91 (2003) 262001)
- Does not fit well with expectations for conventional states
  - above open charm threshold but narrow
- J^{PC} possibilities limited to 1^{++} and 2^{-+} by previous analyses
- LHCb analysis uses production from B decay, and full (5D) angular distribution of decay chain (assuming $J^{PC}(\pi\pi) = 1^{--}$; see also CMS arXiv:1302.3968)
- Likelihood ratio test used to compare hypotheses





J^{PC} = 1++ supports molecular interpretation of X(3872)
… but then how to explain production in hadron collisions?

Unconventional states (II)
Charged bottomonium-like states

Belle
PRL 108 (2012) 122001

Studied in "Υ(5S)" → $(b\bar{b})\pi^+\pi^-$ amplitude analyses

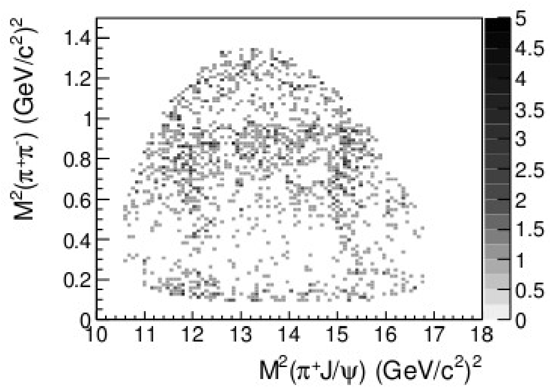
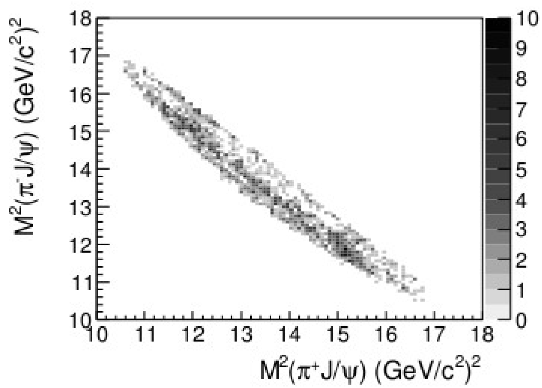
Interpretation of Z_b^+ states as $B^{(*)}B^*$ molecules

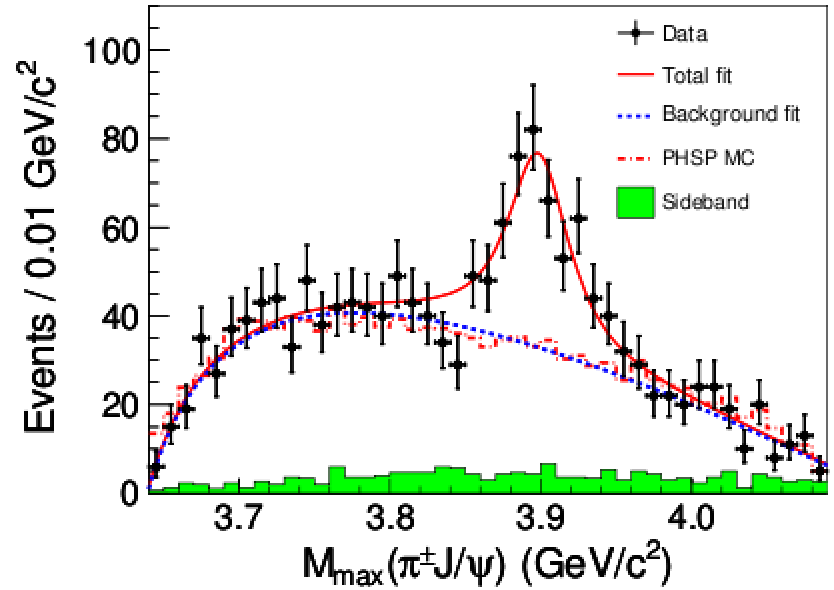
Unconventional states (III)
Charged charmonium-like states

BESIII arXiv:1303.5949
also Belle arXiv:1304.0121

Studied in $Y(4260) \to J/\psi\pi^+\pi^-$
not amplitude analysis







$Z_c(3900)$ adds to a list of claimed charged charmonium-like states
($Z(4430)$ in $\psi'\pi^+$, $Z1(4050)$, $Z2(4250)$ in $\chi_{c1}\pi^+$)

Independent confirmations (or refutations) needed …

Careful amplitude analyses are necessary to understand broad peaks

Selected highlights of results
CP violation and the Unitarity Triangle

The Unitarity Triangle

http://ckmfitter.in2p3.fr
see also http://www.utfit.org

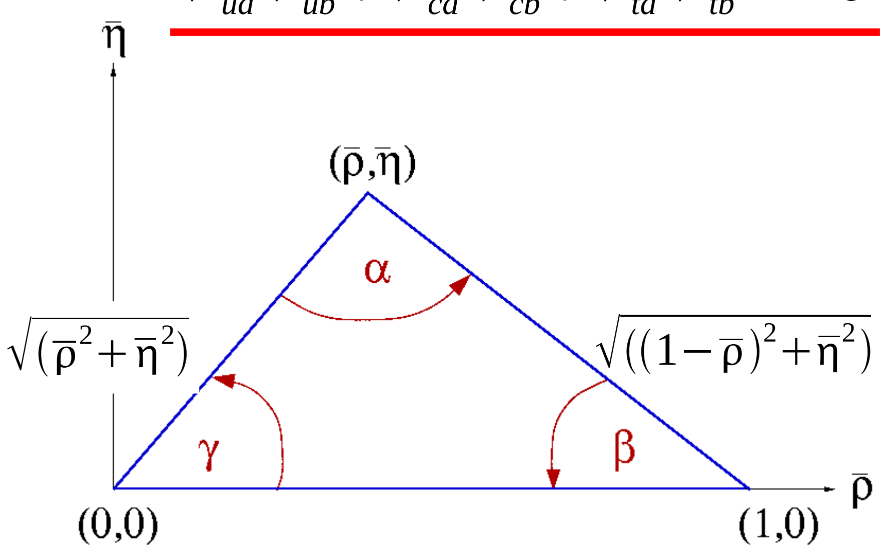
- The CKM matrix must be unitary

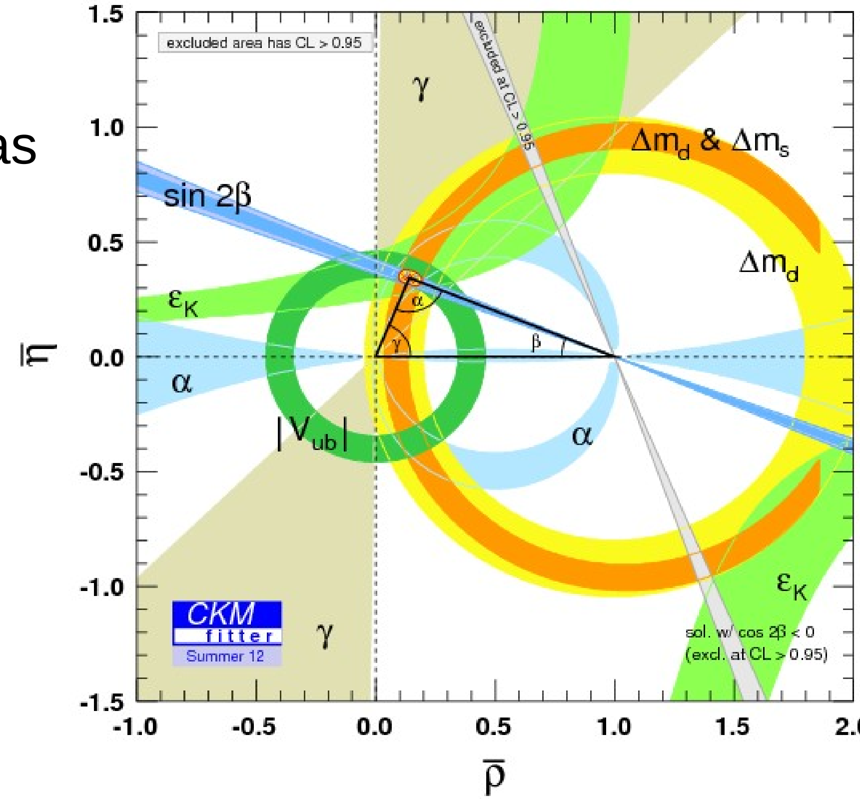
$$V_{CKM}^{+} V_{CKM} = V_{CKM} V_{CKM}^{+} = 1$$

- Provides numerous tests of constraints between independent observables, such as

$$|V_{ud}|^2 + |V_{us}|^2 + |V_{ub}|^2 = 1$$

$$V_{ud} V_{ub}^{*} + V_{cd} V_{cb}^{*} + V_{td} V_{tb}^{*} = 0$$

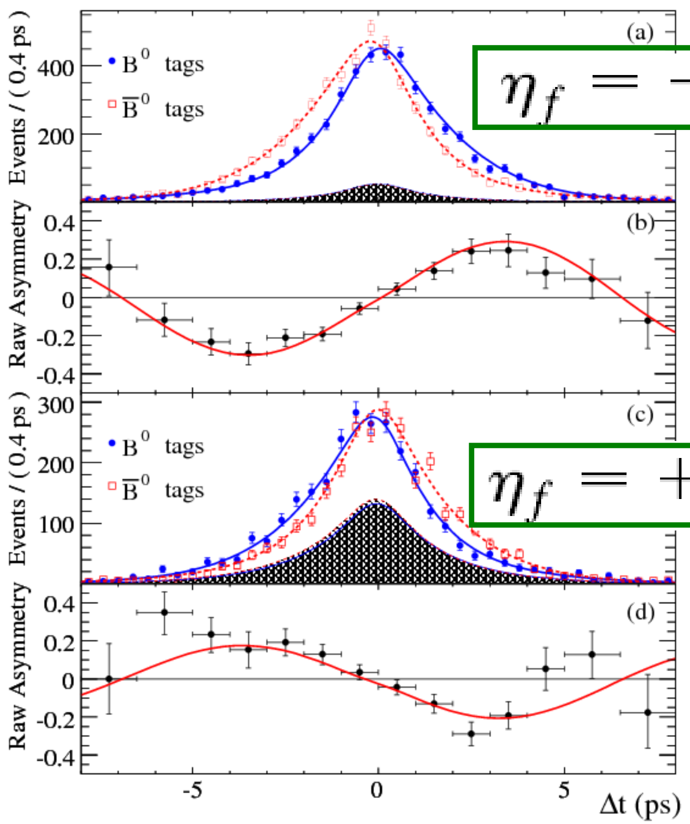




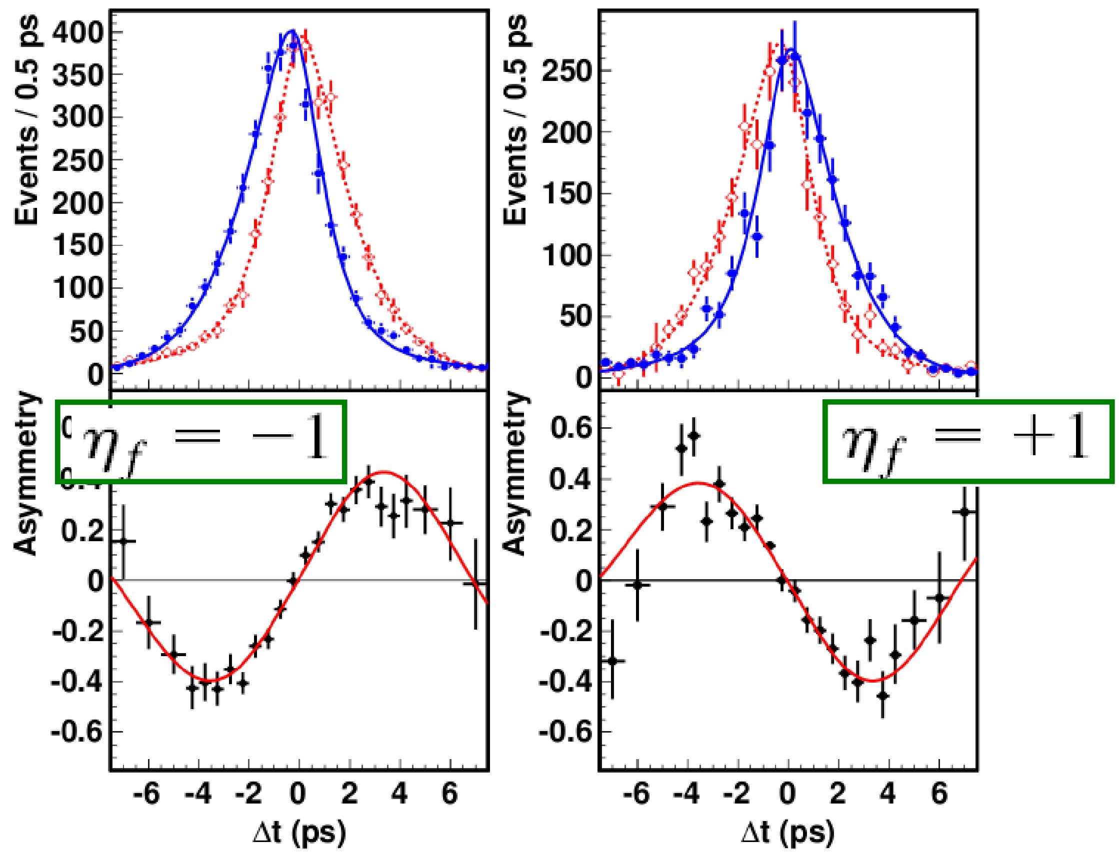
Consistency of measurements tests the Standard Model and provides model-independent constraints on New Physics

Large CP violation effects exist
$\sin(2\beta)$ from $B^0 \rightarrow J/\psi K^0_S$

BABAR



BELLE

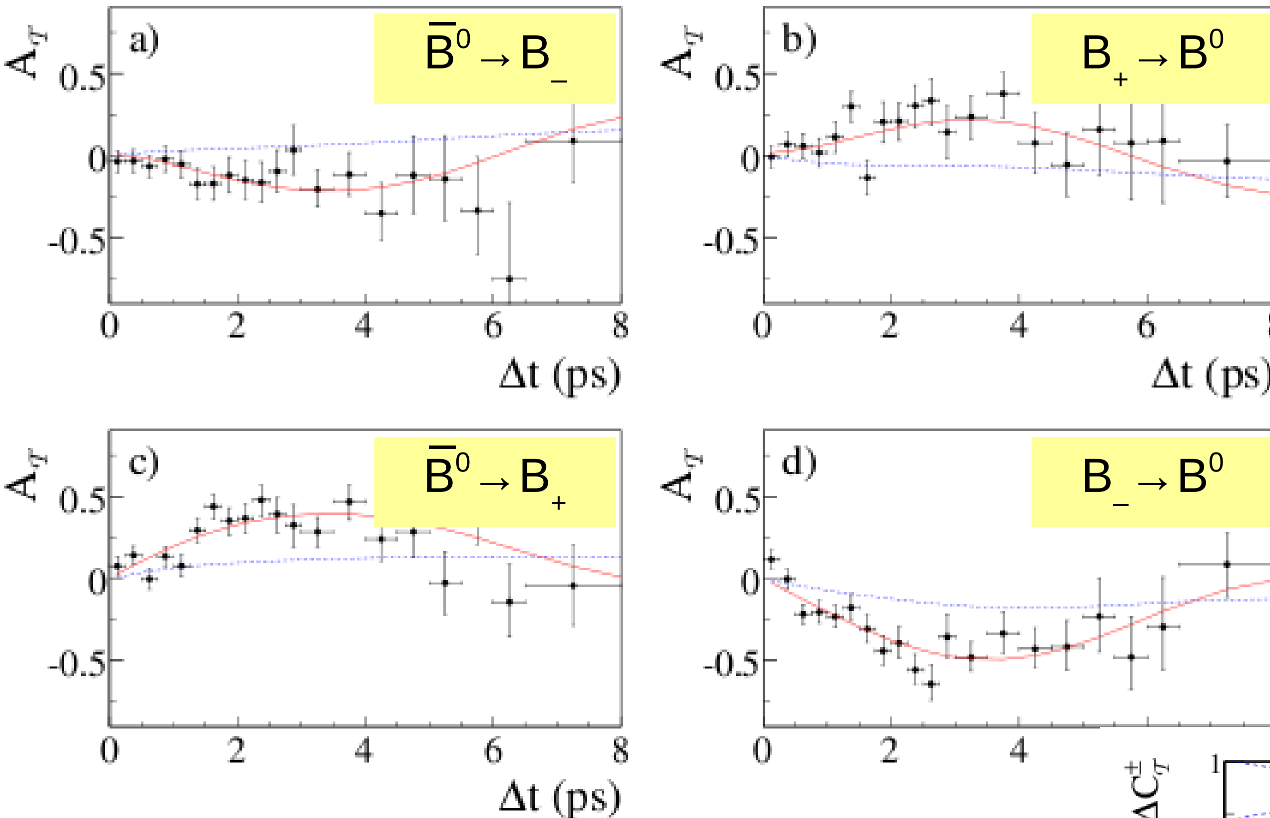


PRD 79 (2009) 072009

PRL 108 (2012) 171802

World average: $\sin(2\beta) = 0.679 \pm 0.020$

… and T is also violated, as expected

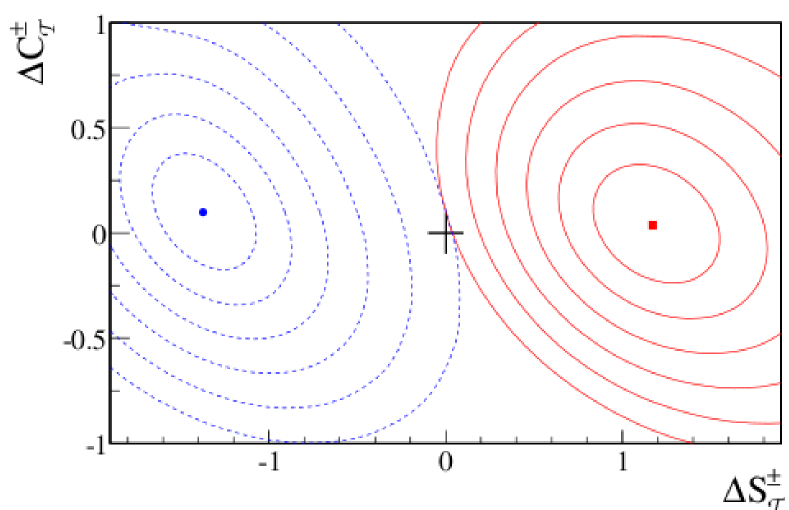


BaBar
PRL 109 (2012) 211801

Generalisation of usual sin(2β) analysis allowing for separate CP, T and CPT violating terms

No significant sign of CPT violation in any test

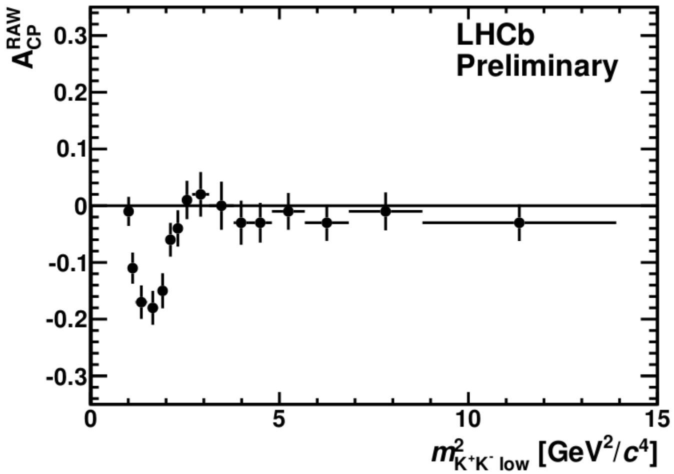
e.g. $A_T(\bar{B}^0 \rightarrow B_-)$ between (l^- tag, $J/\psi K_S$, $\Delta t>0$)
and (l^+ tag, $J/\psi K_L$, $\Delta t<0$)
$\sim ½(\ \Delta S_T^+ \sin(\Delta m_d \Delta t) + \Delta C_T^+ \cos(\Delta m_d \Delta t)\ )$

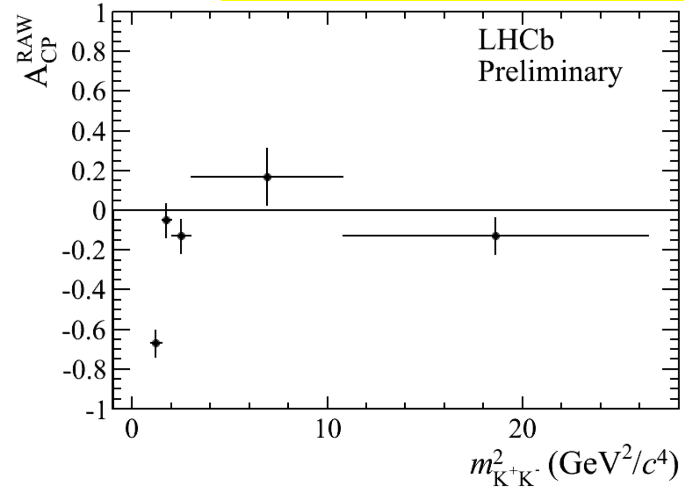


Large *direct* CP violation effects also exist

LHCb-CONF-2012-018, -028

$B \to KKK$

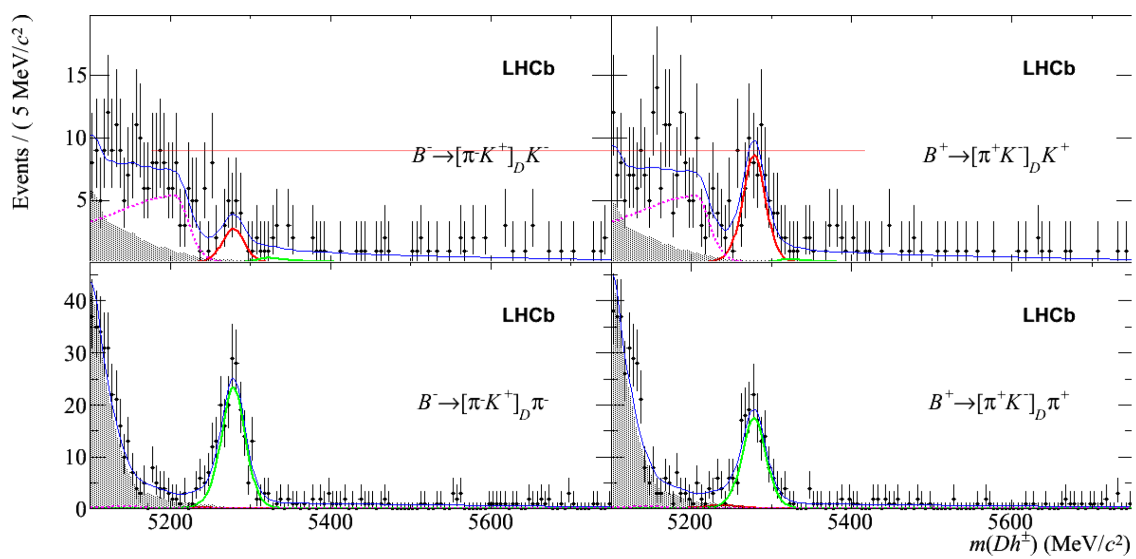




$B \to KK\pi$

Large CP violation effects with strong variation across the Dalitz plot
Detailed studies in progress to understand origin of these effects

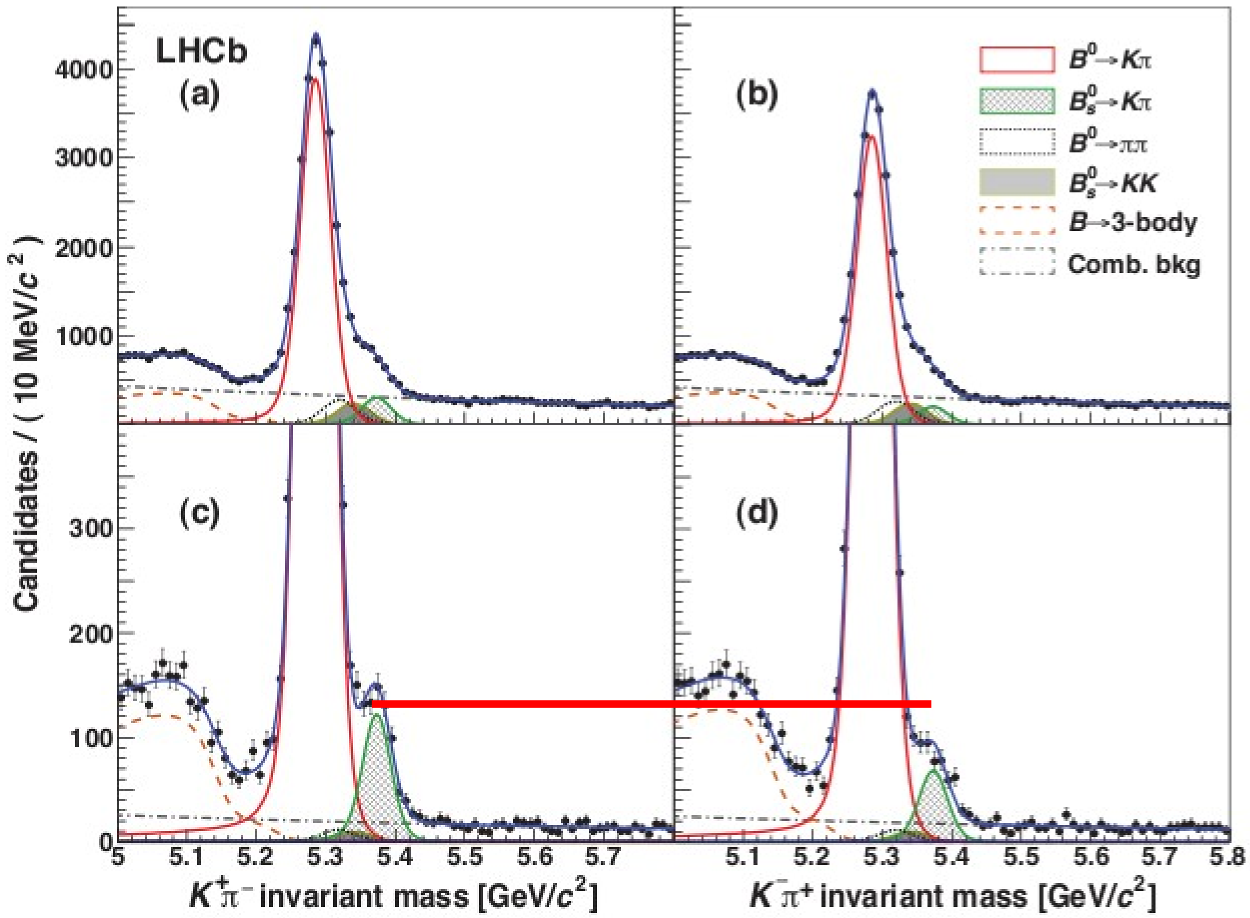
PLB 712 (2012) 203



$B \to D_{ADS} K$

… also in B_s^0 decays

LHCb-PAPER-2013-018
(in preparation)



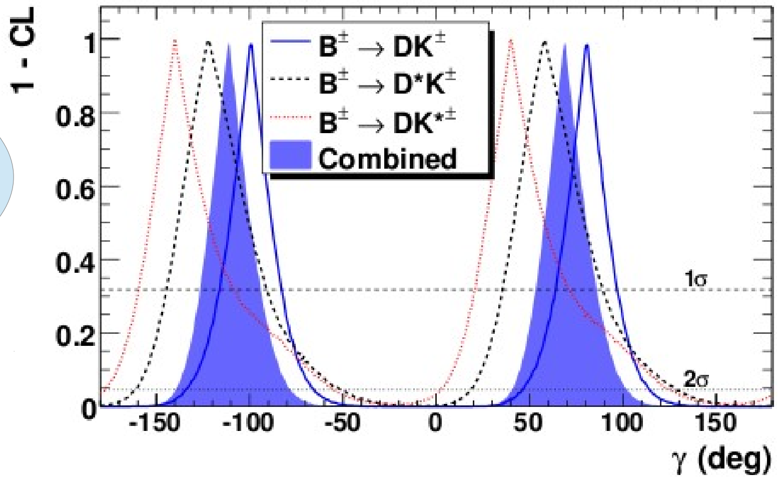
5σ observation of CP violation in $B_s \to K\pi$ decays
Details in talk at Beauty 2013 this week

γ from combination of $B^+ \to DK^+$ modes

BaBar PRD 87 (2013) 052015
Belle CKM2012 preliminary
LHCb-PAPER-2013-020
& LHCb-CONF-2013-006

- All direct CP violation effects caused by γ in the Standard Model
- Only those in $B \to DK$ type processes involve only tree-level diagrams
  - enable determination of γ with negligible theoretical uncertainty
- Several different B and D decays can be used
- Combination includes results from GLW/ADS ($D \to hh$) & GGSZ ($D \to K_S hh$)
- Result shown for BaBar, but Belle & LHCb achieve similar sensitivity ~16°

Update from LHCb to be shown at Beauty 2013
(using 2012 data for GGSZ analysis)
reduces γ uncertainty to ±12°



Is there CP violation in B *mixing*?

Semileptonic asymmetries in both B_d and B_s systems negligibly small in the SM

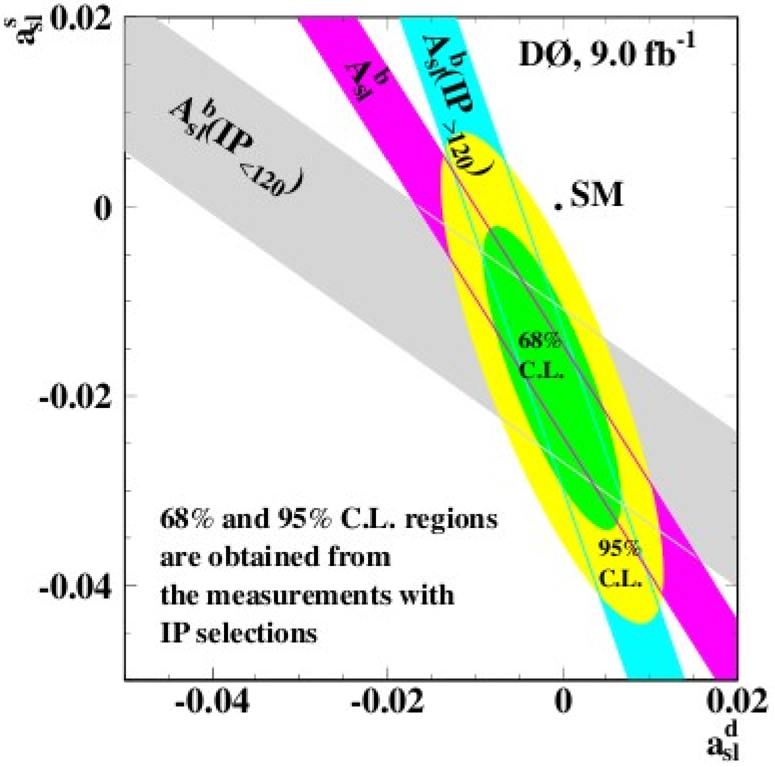
D0 PRD 84 (2011) 052007

Results of inclusive dimuon asymmetry analysis 3.9σ from SM

Systematics reduced by magnet polarity inversions, and from use of control samples, such as single muon sample

$A_{sl}^{b} = (0.594 \pm 0.022)\, a_{sl}^{d} + (0.406 \pm 0.022)\, a_{sl}^{s}$

Constraint in a_{sl}^{d}–a_{sl}^{s} plane obtained from oscillated B_d or B_s enriched samples (cutting on impact parameter)



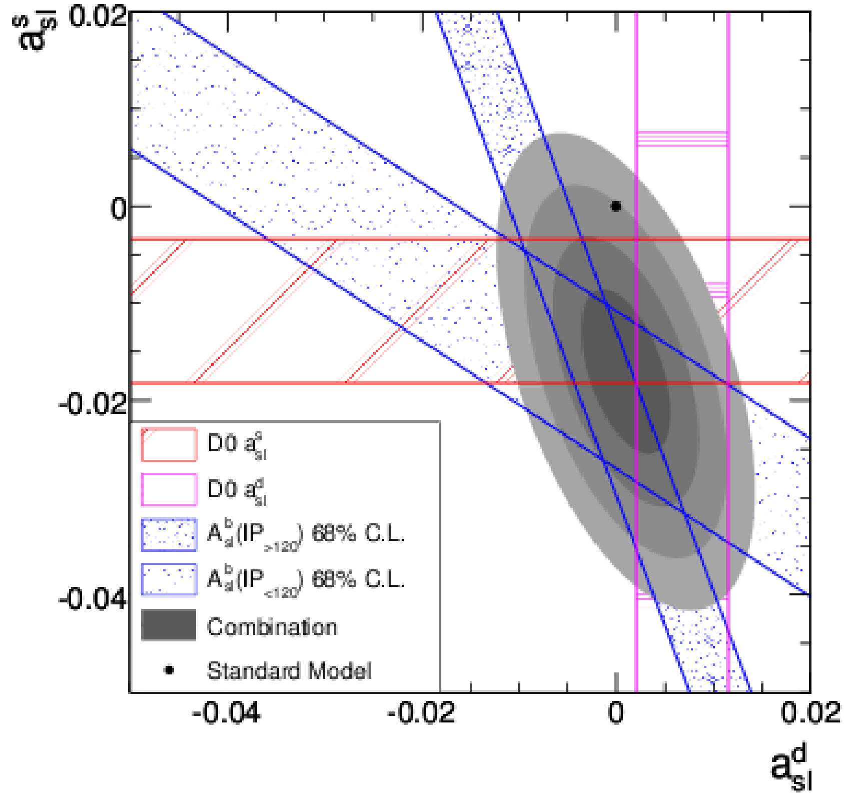
Is there CP violation in B *mixing*?

Semileptonic asymmetries in both B_d and B_s systems negligibly small in the SM

D0 PRD 84 (2011) 052007,
PRL 110 (2013) 011801,
PRD 86 (2012) 072009

Results of inclusive dimuon asymmetry analysis 3.9σ from SM

Including results on a_{sl}^{d} and a_{sl}^{s} individually (from $D^{(*)+}\mu^{-}\nu X$ and $D_s^{+}\mu^{-}\nu X$ samples) puts combination at 2.9σ from SM



Is there CP violation in B *mixing*?

Semileptonic asymmetries in both B_d and B_s systems negligibly small in the SM

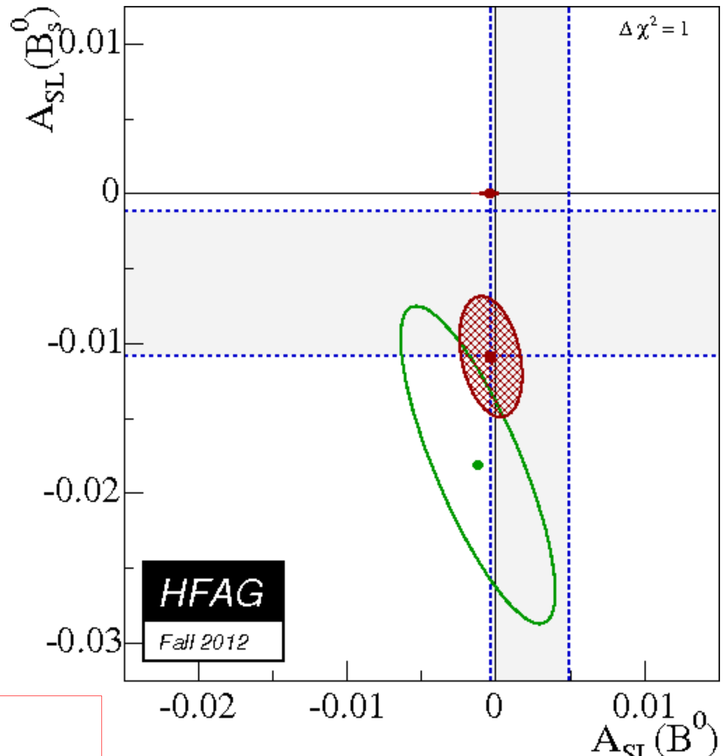
D0 PRD 84 (2011) 052007,
PRL 110 (2013) 011801,
PRD 86 (2012) 072009
LHCb-CONF-2012-022
BaBar CKM2012 preliminary

Results of inclusive dimuon asymmetry analysis 3.9σ from SM

Including results on a_{sl}^d and a_{sl}^s individually (from $D^{(*)+}\mu^-\nu X$ and $D_s^+\mu^-\nu X$ samples) puts combination at 2.9σ from SM

Including B factory a_{sl}^d and LHCb a_{sl}^s results give average 2.4σ from the SM

Situation unclear –
improved measurements needed



Warning: scale changed from previous slide

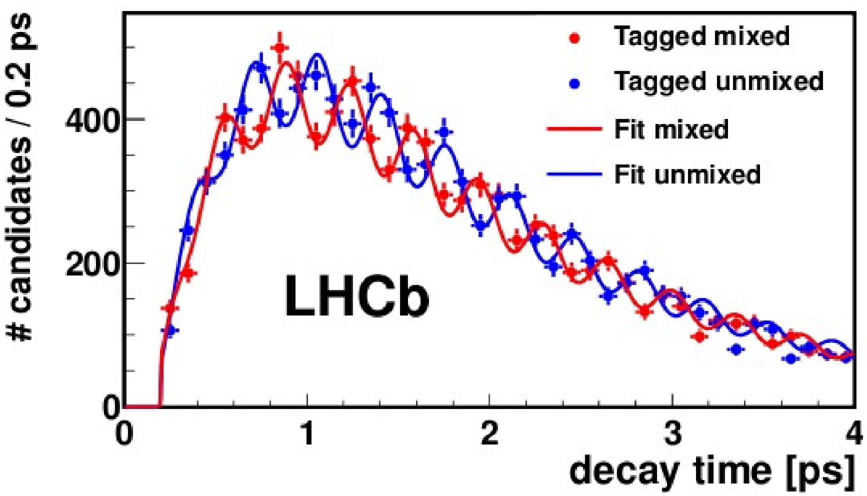
Must prepare for
‰ level measurements

Improved measurements of B_s oscillations and CP violation

LHCb-PAPER-2013-006
In preparation

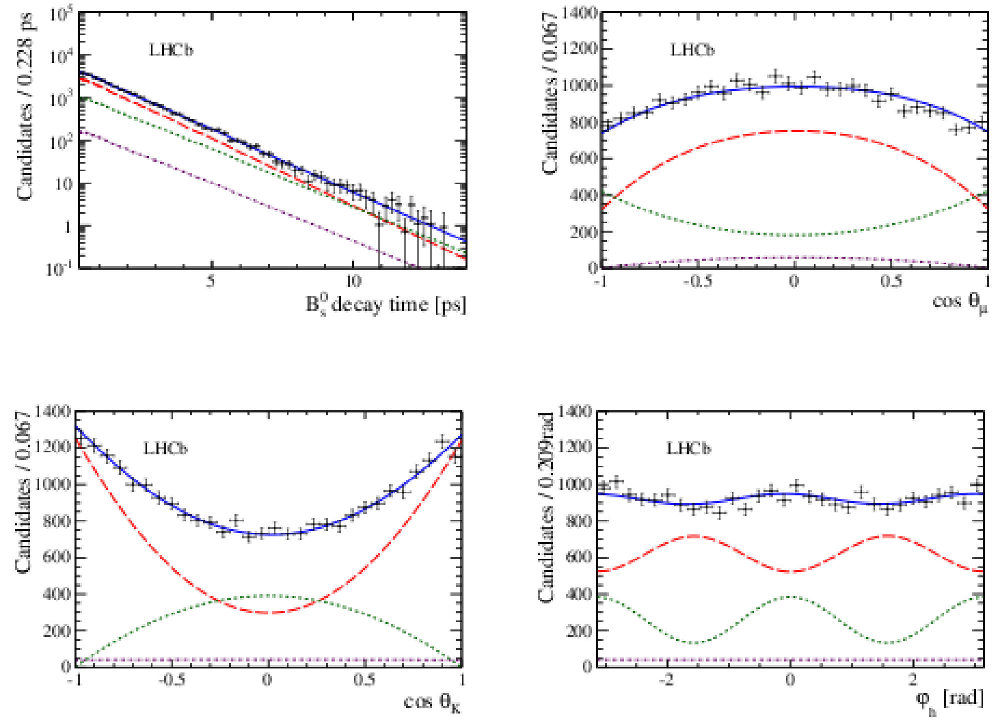
LHCb-PAPER-2013-002
In preparation

$B_s \to D_s \pi$



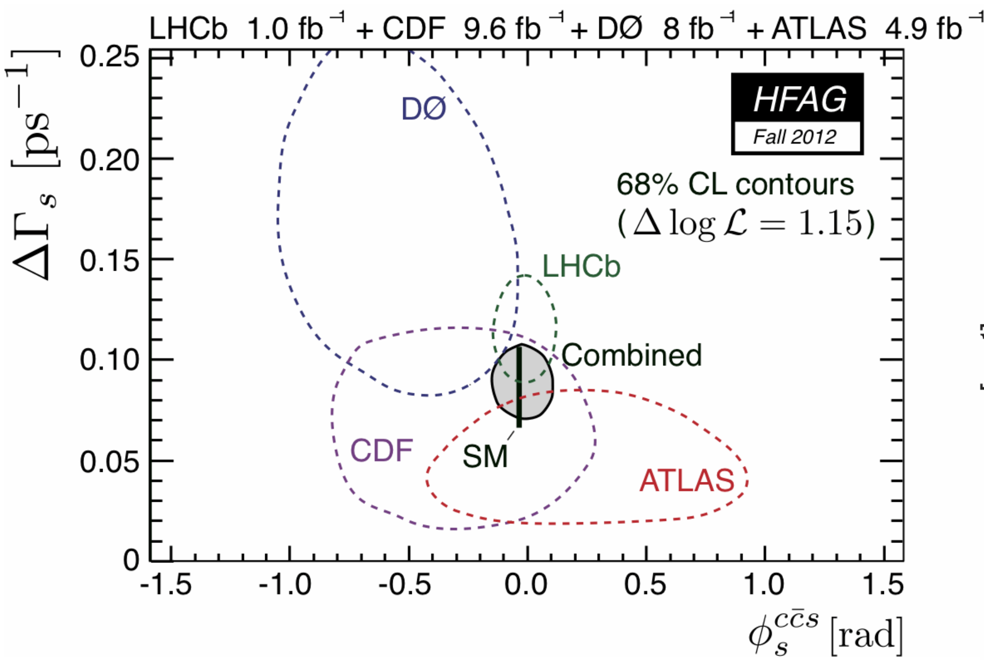
Δm_s = (17.768 ± 0.023 (stat) ± 0.006 (syst)) ps^{-1}
O(‰) precision & still statistically limited

$B_s \to J/\psi KK$ (& $J/\psi\pi\pi$)

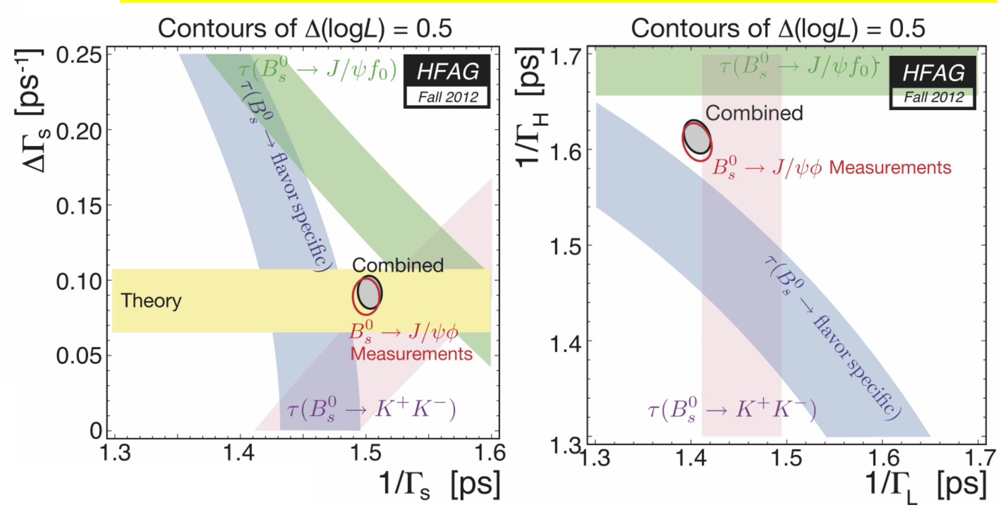


$$\phi_s = 0.01 \pm 0.07 \text{ (stat)} \pm 0.01 \text{ (syst) rad},$$
$$\Gamma_s = 0.661 \pm 0.004 \text{ (stat)} \pm 0.006 \text{ (syst) ps}^{-1},$$
$$\Delta\Gamma_s = 0.106 \pm 0.011 \text{ (stat)} \pm 0.007 \text{ (syst) ps}^{-1}.$$

Improved measurements of B_s lifetimes and CP violation

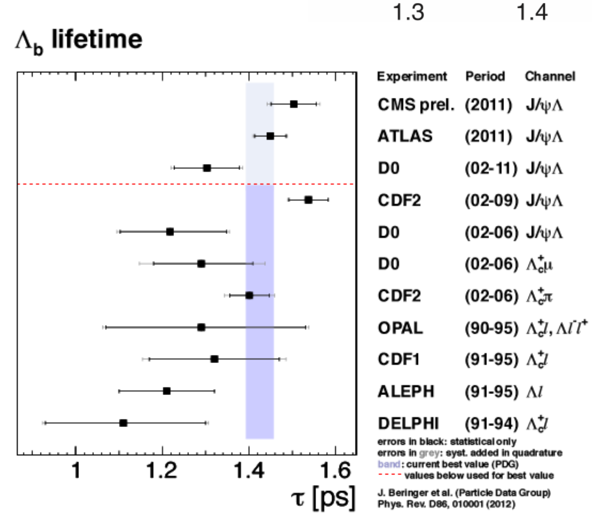


LHCb-PAPER-2013-002
CDF PRD 85 (2012) 072002
D0 PRD 85 (2012) 032006
ATLAS JHEP 12 (2012) 072
See also CMS-PAS-BPH-11-006



N.B. Improved Λ_b lifetime measurements of great interest:

D0 PRD 85 (2012) 112003
ATLAS PRD 87 (2013) 032002
CMS BPH-11-013



… tensions with expectations reduced

Is there CP violation in the charm system?

(and if so, where does it come from?)

To reduce systematics and (perhaps) enhance CP violation effect, experiments measure

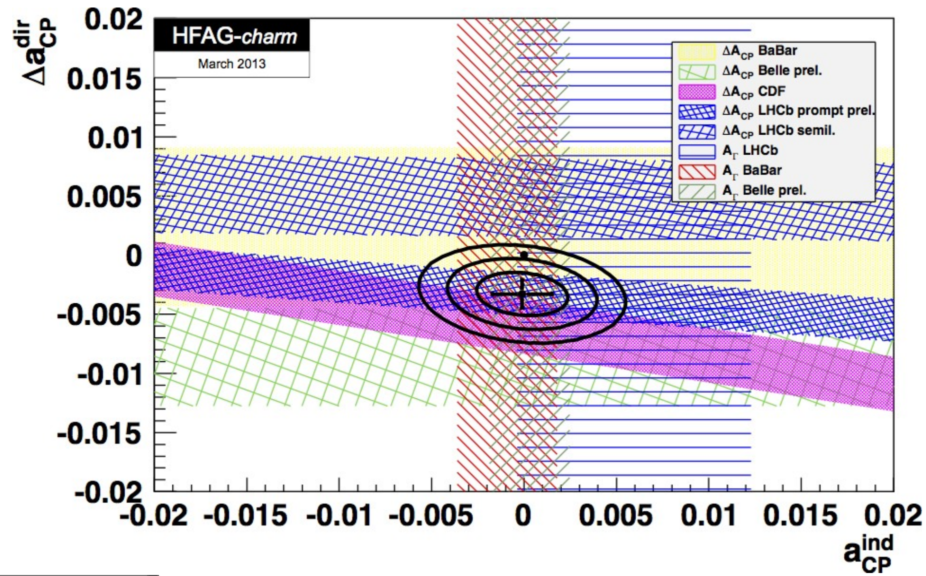
$$\Delta A_{CP} \equiv A_{CP}(K^-K^+) - A_{CP}(\pi^-\pi^+)$$
$$= \left[a_{CP}^{\rm dir}(K^-K^+) - a_{CP}^{\rm dir}(\pi^-\pi^+)\right] + \frac{\Delta\langle t\rangle}{\tau} a_{CP}^{\rm ind}.$$

ΔA_{CP} related mainly to direct CP violation

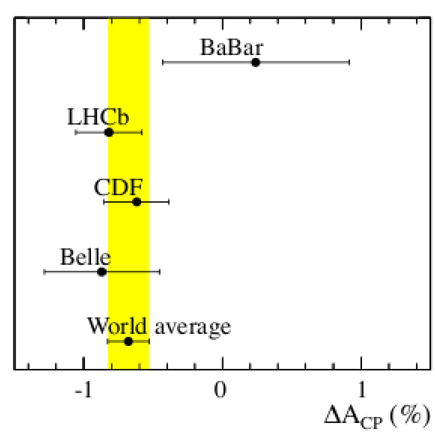
(contribution from indirect CPV suppressed by difference in mean decay time)

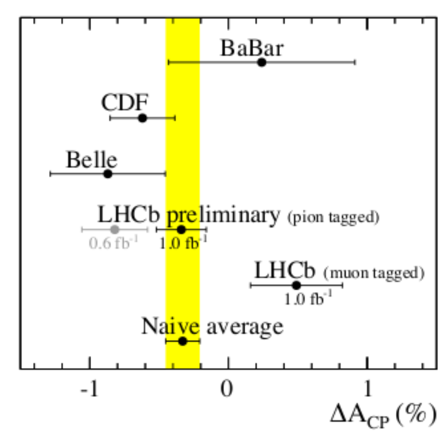
$$\Delta a_{CP}^{dir} = (-0.33 \pm 0.12)\%$$

LHCb arXiv:1303.2614, LHCb-CONF-2013-003
CDF PRL 109 (2012) 111801
Belle ICHEP preliminary



Previous evidence for CPV not confirmed
Need more precise measurements





All shifts consistent with being statistical in origin

Observation of D^0-$\bar{D}^0$ oscillations

(first step towards measurement CP violation in charm mixing)

LHCb PRL 110 (2013) 101802

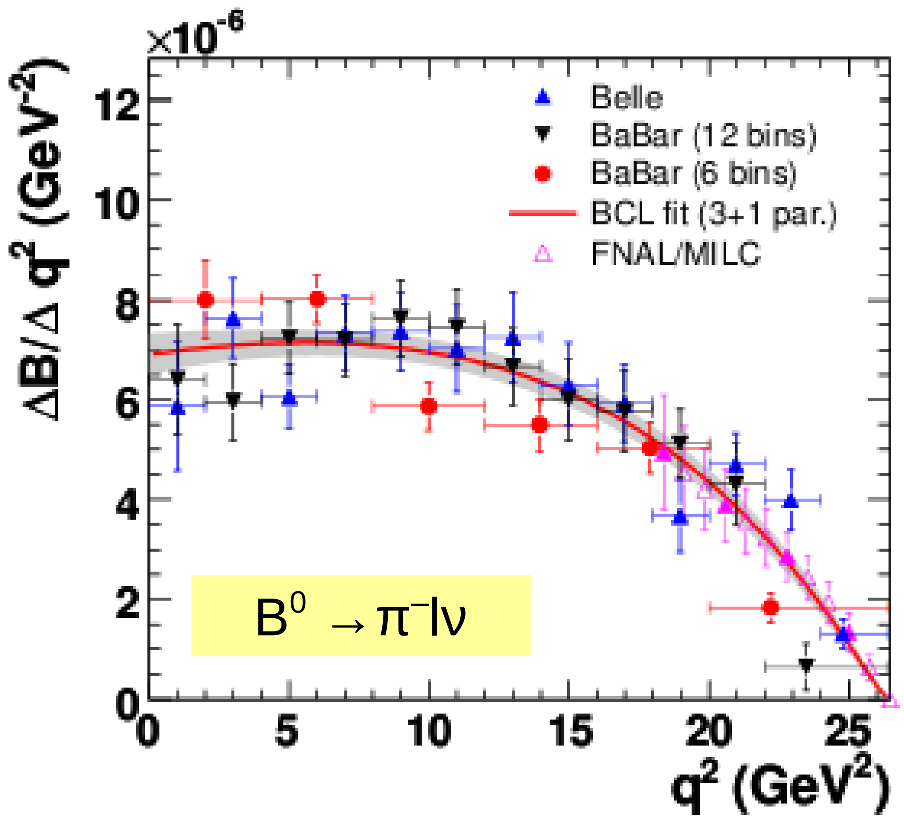
Quark Flavour Physics

$|V_{ub}|$ from {in,ex}clusive semileptonic decays

PBFLB based on
BaBar PRD 83 (2011) 052011 &
PRD 83 (2011) 032007
Belle PRD 83 (2011) 071101(R)



lattice uncertainty

Some tension between exclusive and inclusive results. PBFLB concludes:

$$|V_{ub}|_{\rm excl} = [3.23\ (1 \pm 0.05_{\rm exp} \pm 0.08_{\rm th})] \times 10^{-3}$$
$$|V_{ub}|_{\rm incl} = [4.42\ (1 \pm 0.045_{\rm exp} \pm 0.034_{\rm th})] \times 10^{-3}.$$

This average has a probability of $P(\chi^2) = 0.003$. Thus we scale the error by $\sqrt{\chi^2} = 3.0$ and arrive at

$$|V_{ub}| = [3.95\ (1 \pm 0.096_{\rm exp} \pm 0.099_{\rm th})] \times 10^{-3}$$

Similar tension also for $|V_{cb}|$

Better understanding needed to reduce uncertainty

$B \to \tau\nu$ & $B \to D^{(*)}\tau\nu$

First measurement of zero-crossing point of A_{FB}

$q^2_0 = (4.9 \pm 0.9)$ GeV^2/c^4

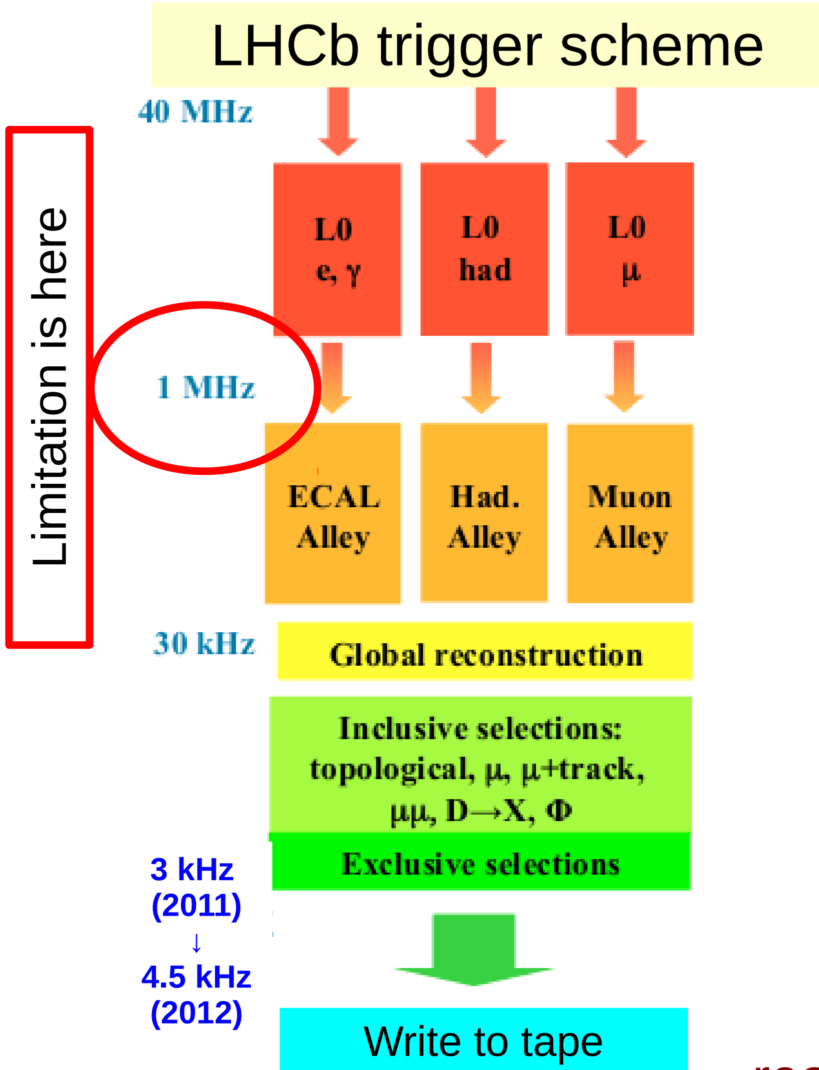
Consistent with SM expectation

Future prospects

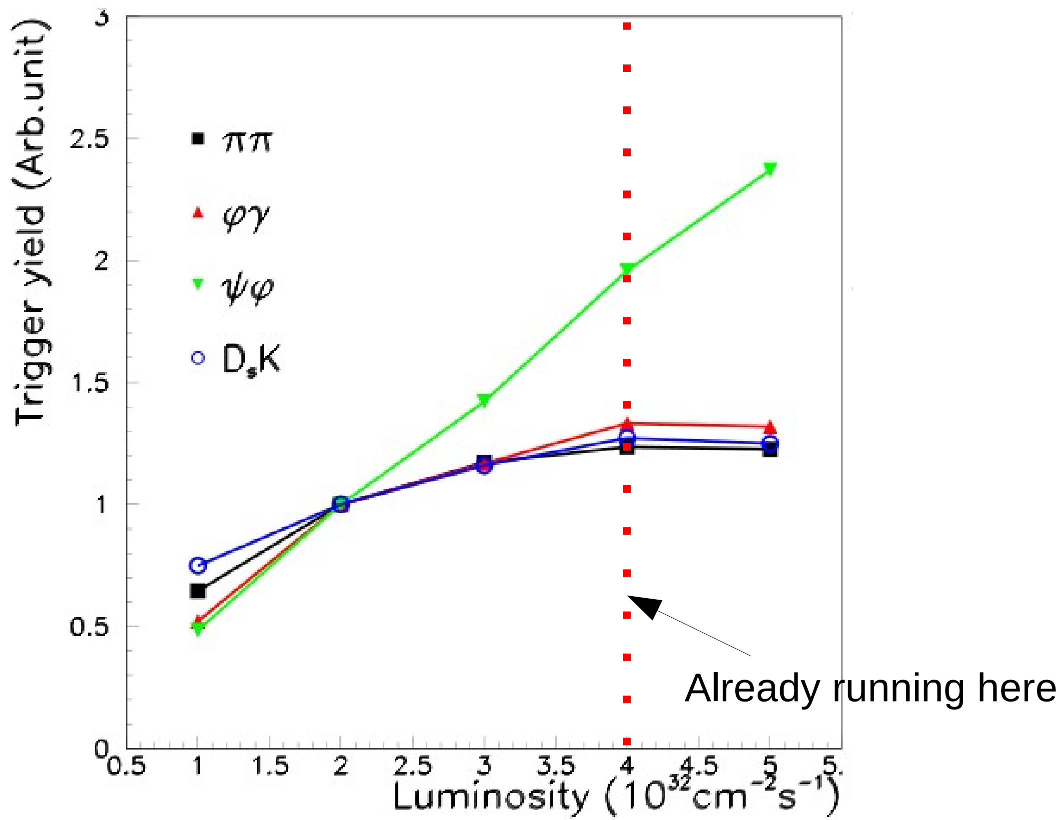
Quark flavour physics: short and mid-term projects

- Good short-term prospects with existing experiments
  - LHCb & BES taking new data plus final analyses from completed experiments
  - NA62 and K0T0 coming online to probe $K \to \pi\nu\nu$ decays
- In the second half of this decade will transition to next generation experiments → very exciting future!
  - Belle2 (start 2016/7) & LHCb upgrade (start 2019)
  - possibilities for τ-charm factories in Russia, Turkey, Italy
    - SuperB unfortunately cancelled, however
  - K0T0 phase II, ORKA, possible extension of NA62

LHC upgrade and the all important trigger

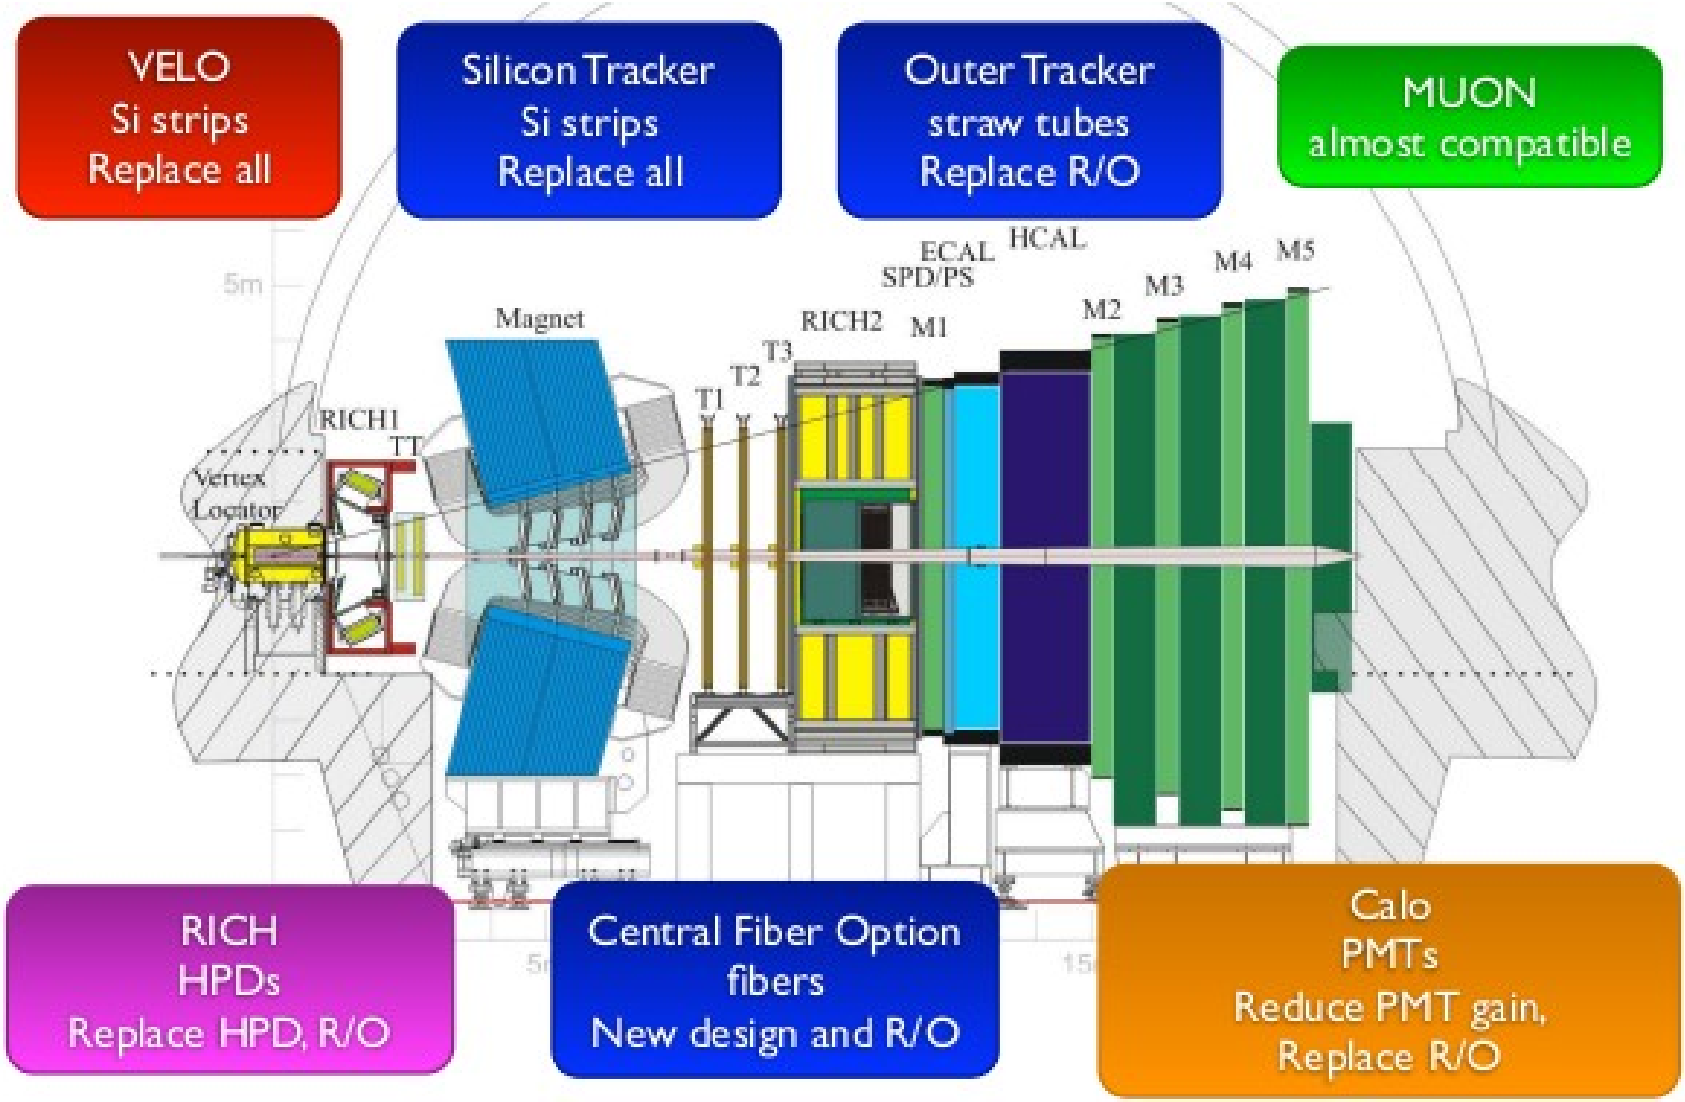


higher luminosity
→ need to cut harder at L0 to keep rate at 1 MHz
→ lower efficiency



- readout detector at 40 MHz
- implement trigger fully in software → efficiency gains
- run at L_{inst} up to 2 10^{32}/cm^2/s

LHCb detector upgrade



Several options still under study (e.g. strips/pixels for VELO)
Decisions to be made soon with TDRs available ~end 2013

LHCb upgrade timeline

- 2011
  - Letter of Intent: CERN-LHCC-2011-001
- 2012
  - Framework TDR: CERN-LHCC-2012-007
    - Endorsed by LHCC and approved by CERN Research Board (minutes)
    - Also prominent in draft European Strategy for Particle Physics
  - See also arXiv:1208.3355 for physics discussion
- 2013
  - Sub-detector TDRs ← preparation of TDRs already started
- 2014-17
  - Final R&D, production and construction
- 2018 (LS2)
  - Installation of upgraded LHCb detector (requires 18 months)

The need for more precision

- "Imagine if Fitch and Cronin had stopped at the 1% level, how much physics would have been missed"

  – A.Soni

- "A special search at Dubna was carried out by Okonov and his group. They did not find a single $K_L^0 \to \pi^+\pi^-$ event among 600 decays into charged particles (Anikira et al., JETP 1962). At that stage the search was terminated by the administration of the lab. The group was unlucky."

  – L.Okun

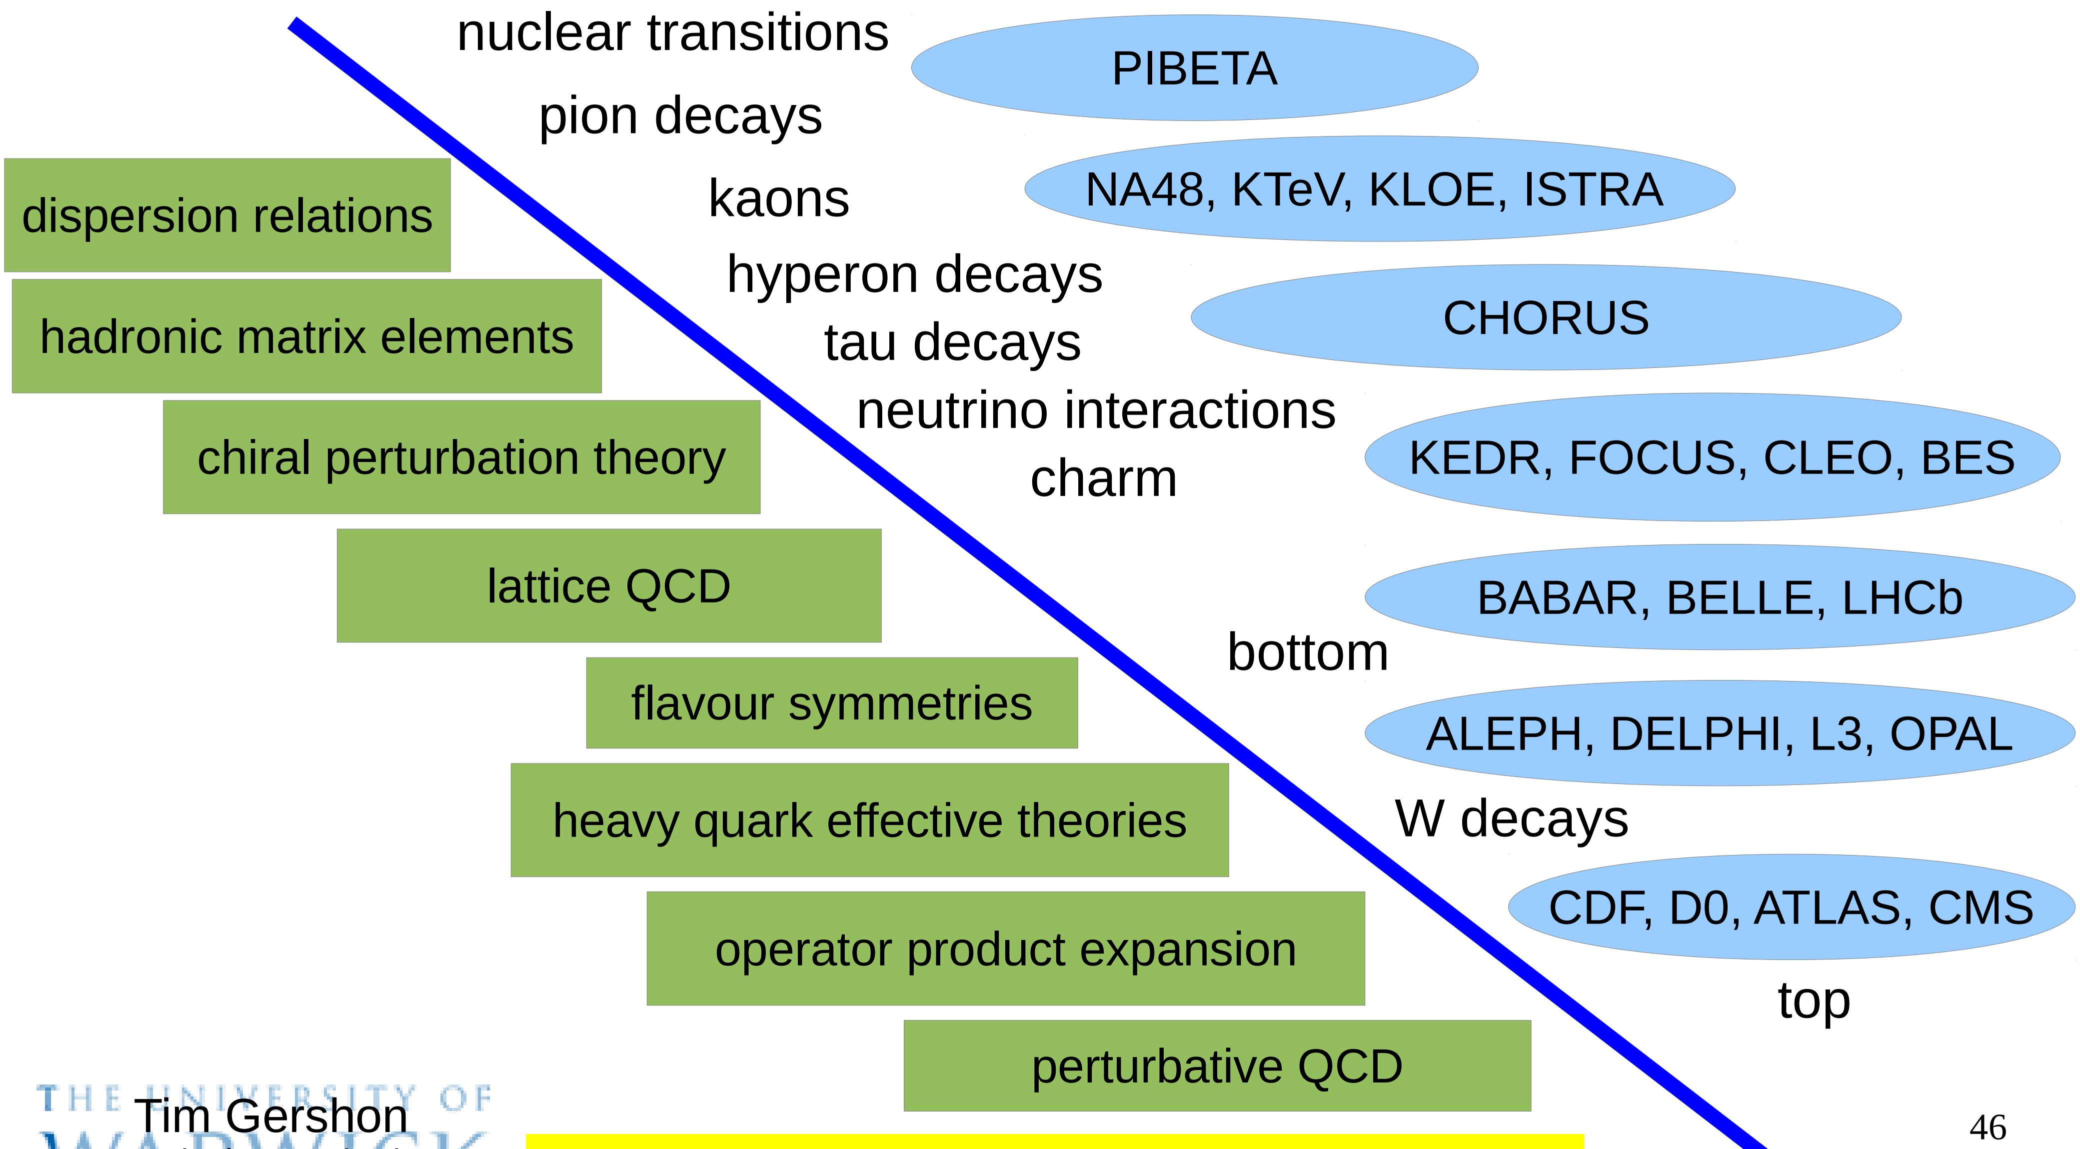
(remember: $B(K_L^0 \to \pi^+\pi^-) \sim 2\ 10^{-3}$)

Summary

- Huge recent progress in quark-flavour physics
  - many important new results from BaBar, Belle, BES, CDF, D0, …
  - and in particular, LHCb, which has definitively proved the concept of a forward spectrometer at a hadron collider
- Standard Model still survives
  - several "tensions" alleviated with improved measurements
  - further investigation still needed in many areas (a_{sl}, $B \to D^{(*)}\tau\nu$, etc.)
  - not a cause for depression! Now probing regions where "realistic" new physics effects might appear
- Exciting short- and mid-term prospects
  - next generation experiments in kaon, charm and B physics
  - LHCb upgrade confirmed as a core component of LHC exploitation

Back up

Range of CKM phenomena



apologies for omissions

CP violation and the matter-antimatter asymmetry

- Two widely known facts

  1) CP violation is one of 3 "Sakharov conditions" necessary for the evolution of a baryon asymmetry in the Universe

  2) The Standard Model (CKM) CP violation is not sufficient to explain the observed asymmetry

- Therefore, there must be more sources of CP violation in nature … but where?
  - extended quark sector, lepton sector (leptogenesis), supersymmetry, anomalous gauge couplings, extended Higgs sector, quark-gluon plasma, flavour-diagonal phases, …
- Testing the consistency of the CKM mechanism provides the best chance to find new sources of CP violation today

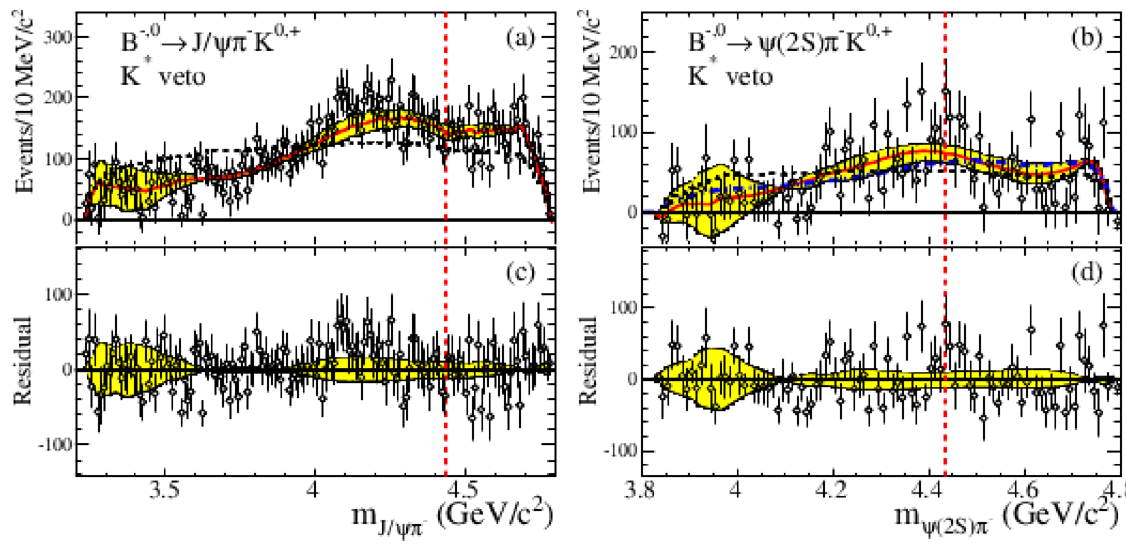
BABAR PRD 79 (2009) 112001

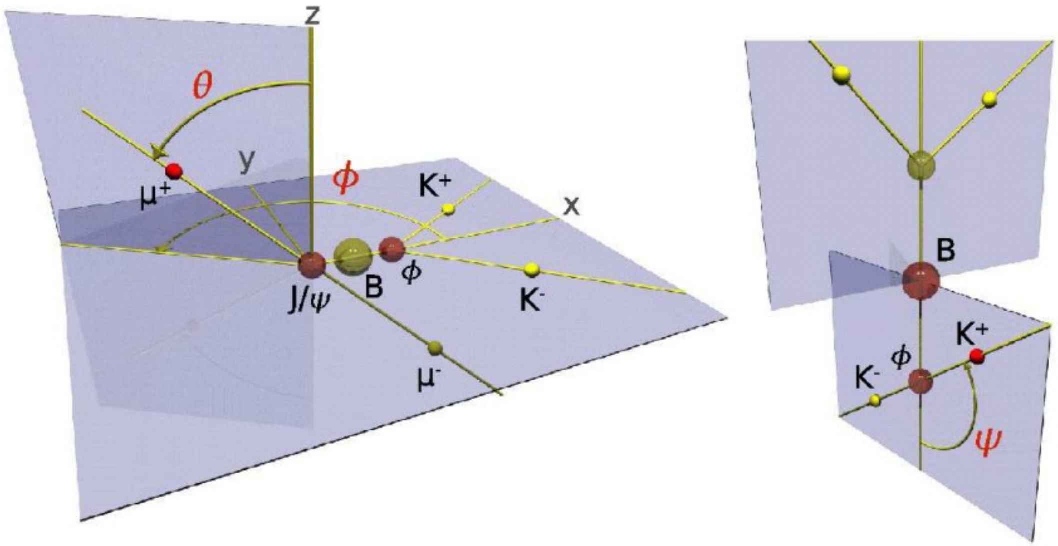


Clear peak
Still there in more detailed analysis
PRD 80 (2009) 031104

Data consistent with Kπ reflections
Slight peak but no evidence for new state
But also consistent with Belle

Need more experimental input
(CDF, D0, ATLAS, CMS or LHCb)

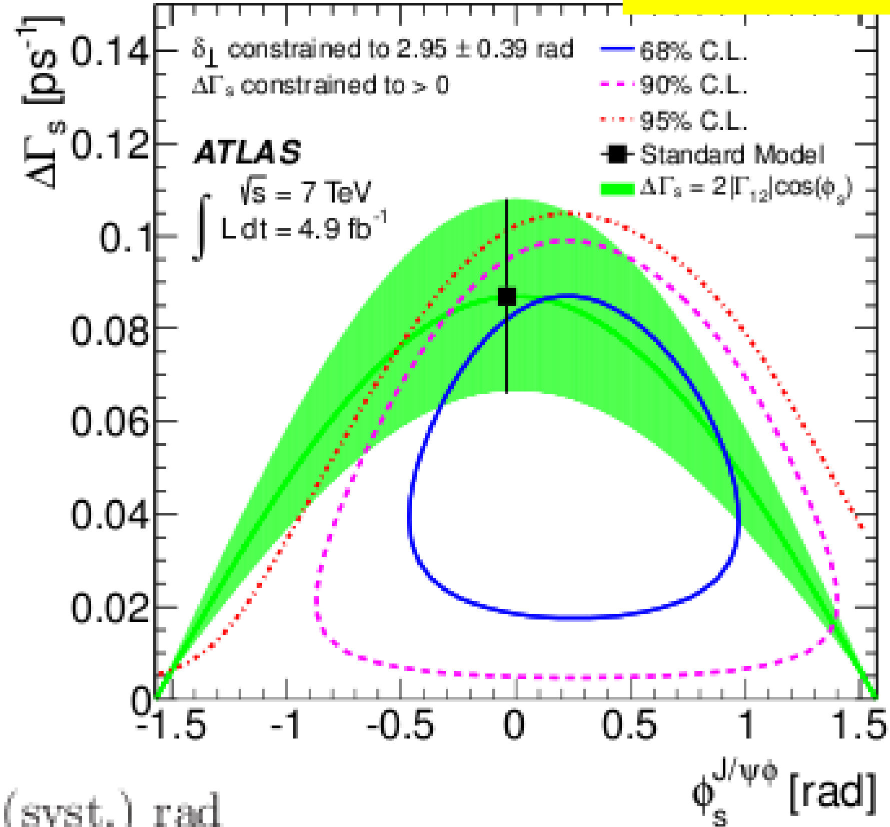
$\Phi_s = -2\beta_s$ ($B_s \rightarrow J/\psi\varphi$)



- VV final state
  - three helicity amplitudes
  - → mixture of CP-even and CP-odd
  - disentangled using angular & time-dependent distributions
  - → additional sensitivity
  - many correlated variables
  - → complicated analysis
- LHCb also uses $B_s \rightarrow J/\psi f_0$ ($f_0 \rightarrow \pi^+\pi^-$)
  - CP eigenstate; simpler analysis
  - fewer events; requires input from $J/\psi\varphi$ analysis (Γ_s, $\Delta\Gamma_s$)

ATLAS results on $B_s \rightarrow J/\psi\phi$

JHEP 12 (2012) 072



$$\phi_s = 0.22 \pm 0.41 \text{ (stat.)} \pm 0.10 \text{ (syst.) rad}$$

$$\Delta\Gamma_s = 0.053 \pm 0.021 \text{ (stat.)} \pm 0.008 \text{ (syst.) ps}^{-1}$$

$$\Gamma_s = 0.677 \pm 0.007 \text{ (stat.)} \pm 0.004 \text{ (syst.) ps}^{-1}$$

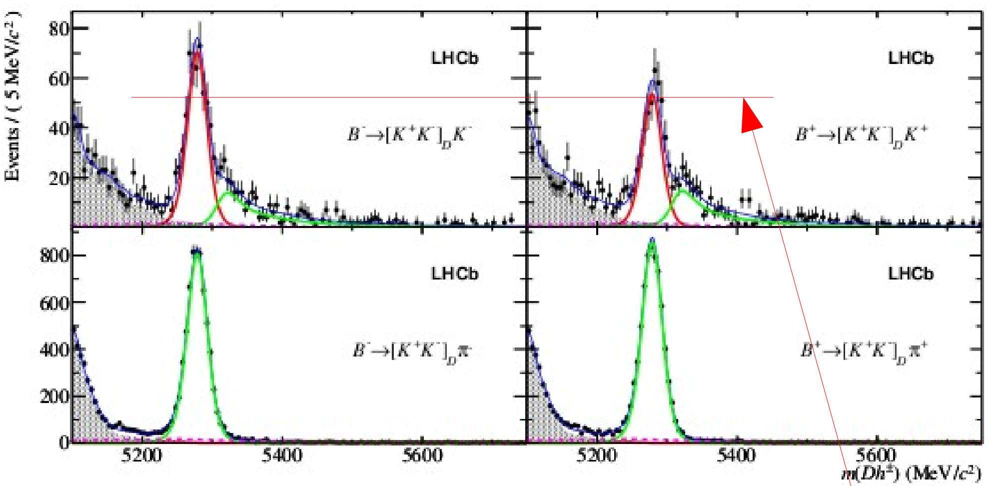
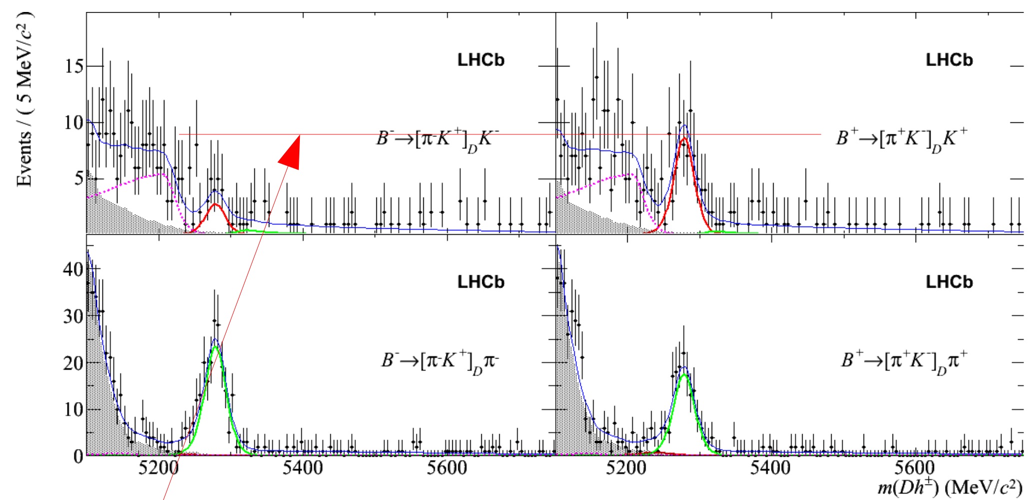
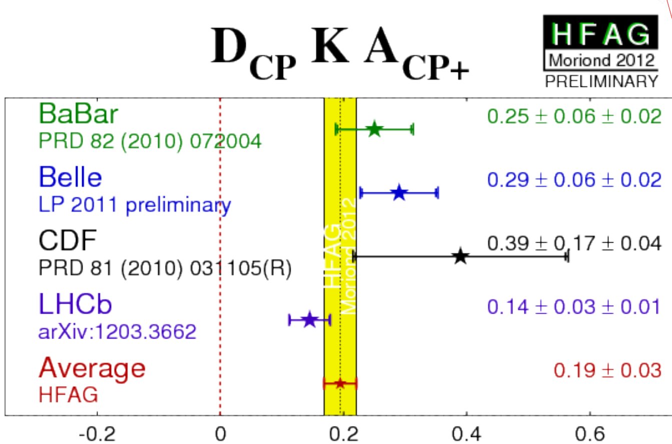
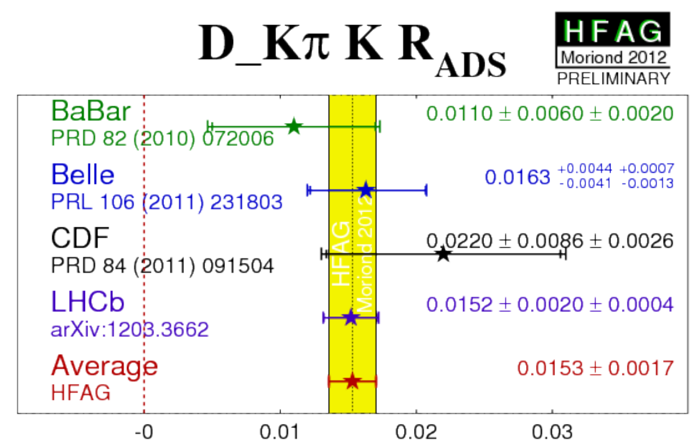
LHCb
Phys. Lett. B 712 (2012) 203









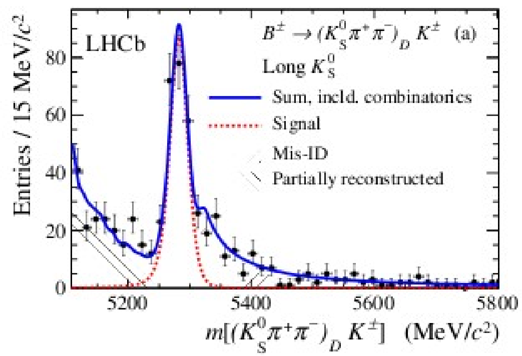
Observation of CP violation in B → DK decays

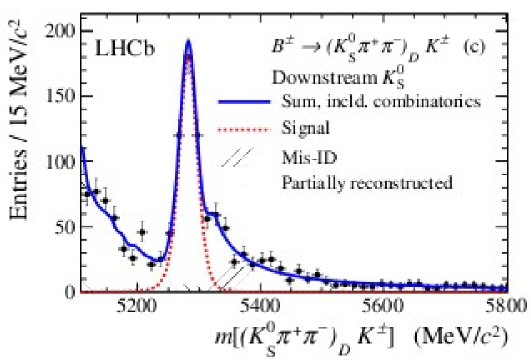
γ from $B^+ \to DK^+$, $D \to K^0_S h^+h^-$

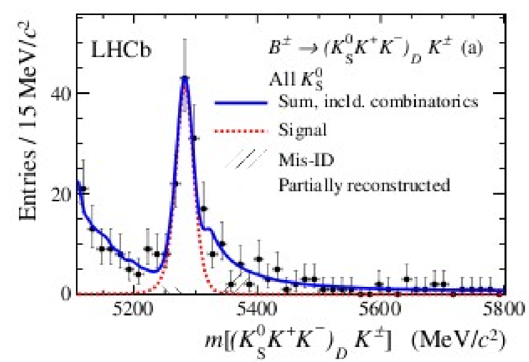
LHCb (1/fb)
Phys. Lett. B 718 (2012) 43

- Results from “GGSZ” mode very important to break ambiguities in determination of γ
- Model-independent approach using $D \to K^0_S\pi^+\pi^-$ and (world first) $D \to K^0_S K^+K^-$

$K^0_S\pi^+\pi^-$ in two K^0_S categories





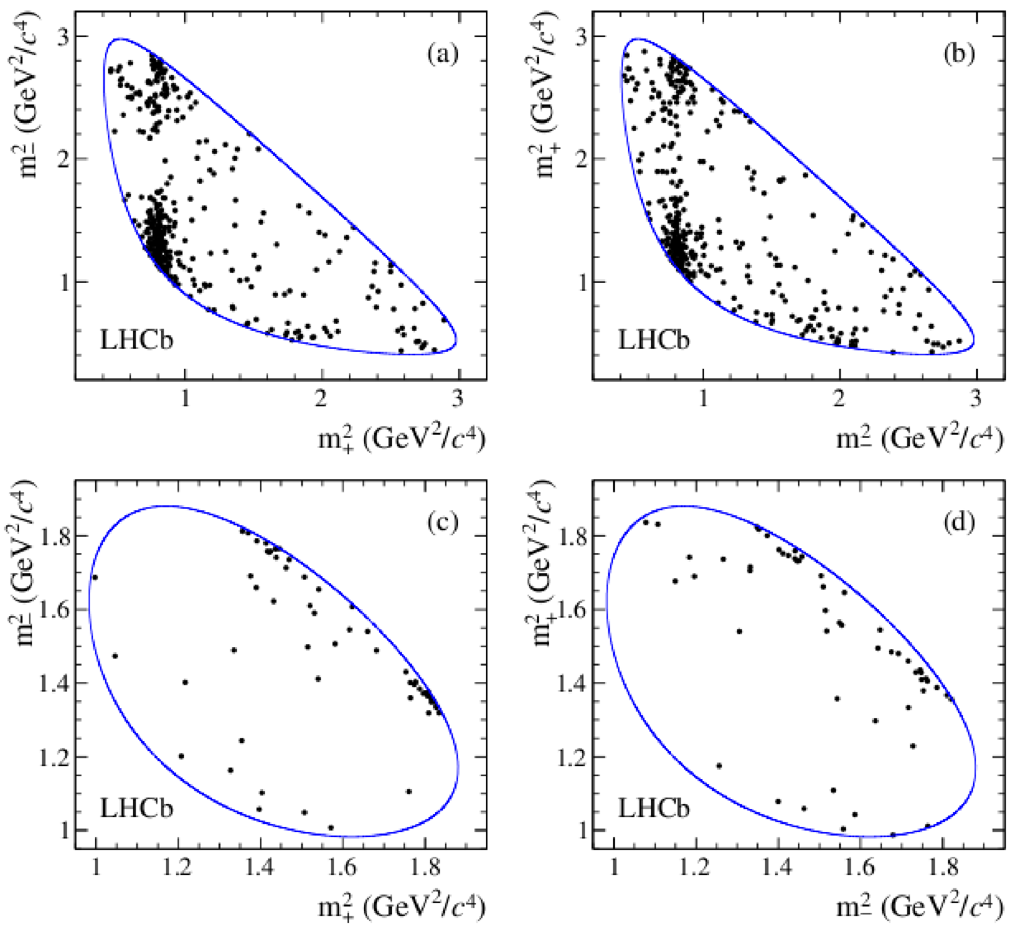


$K^0_S K^+K^-$
(all combined)

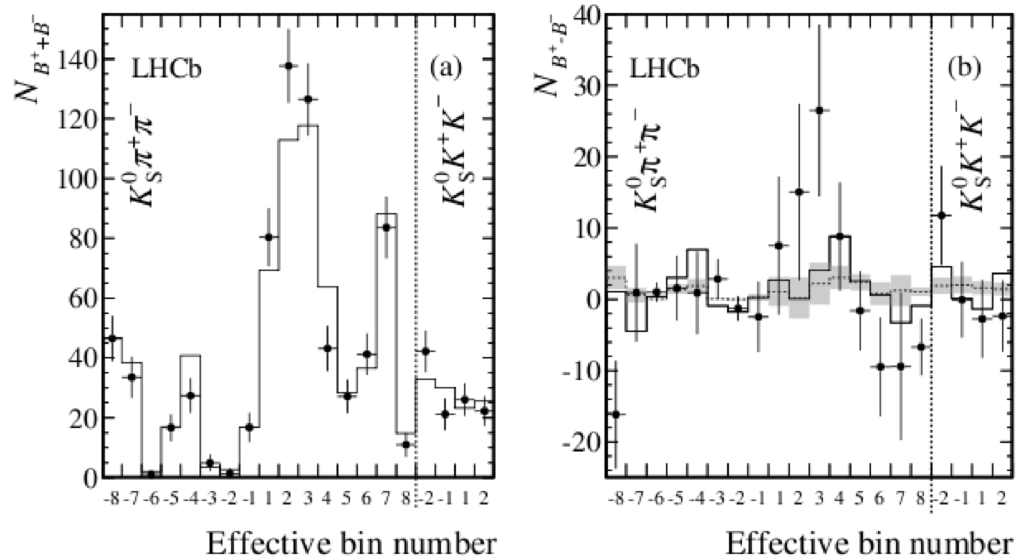
γ from $B^+ \to DK^+$, $D \to K^0_S h^+h^-$

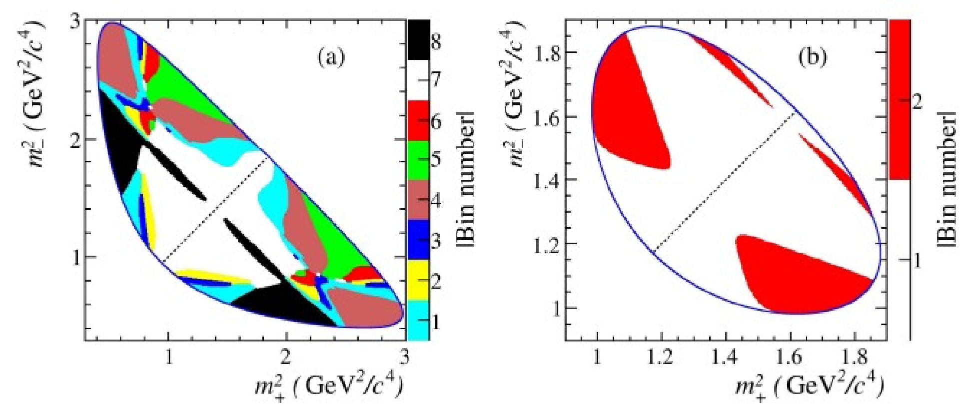
LHCb (1/fb)
Phys. Lett. B 718 (2012) 43

Reconstruct Dalitz plot distributions ...



… bin them ...
(in complicated but ~optimal way)

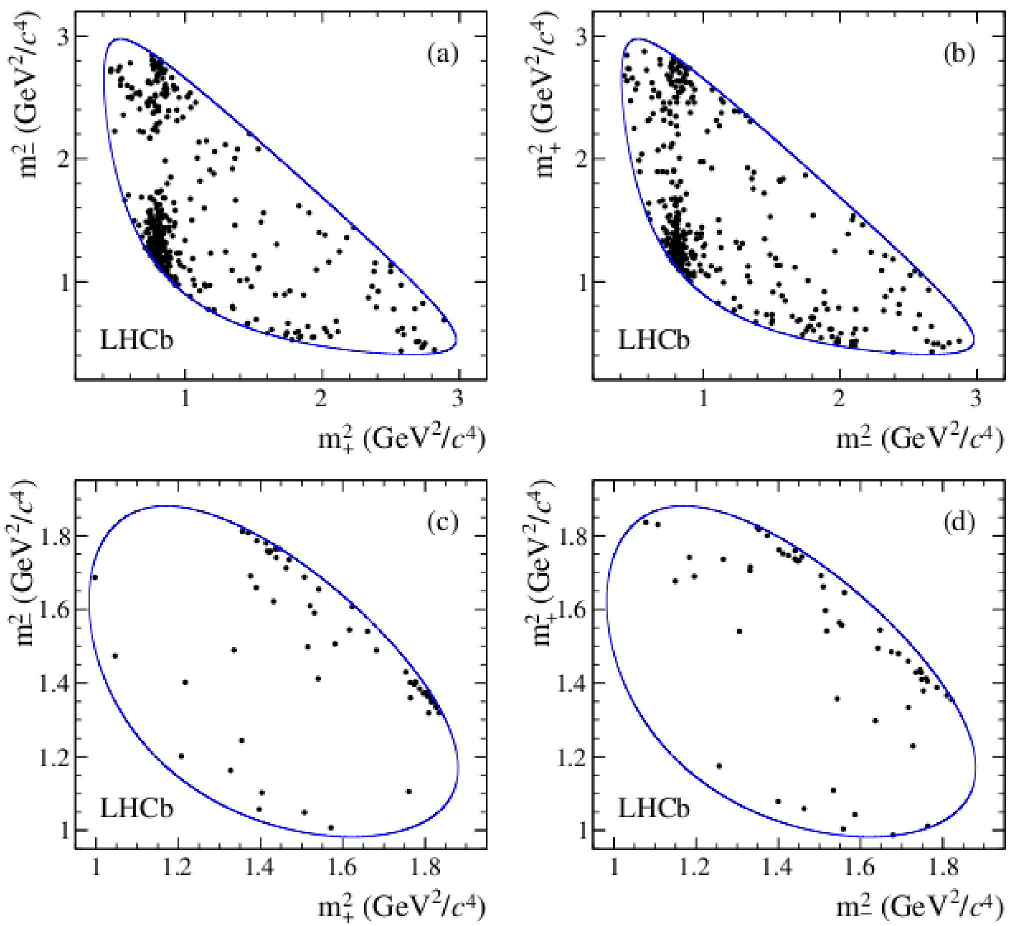




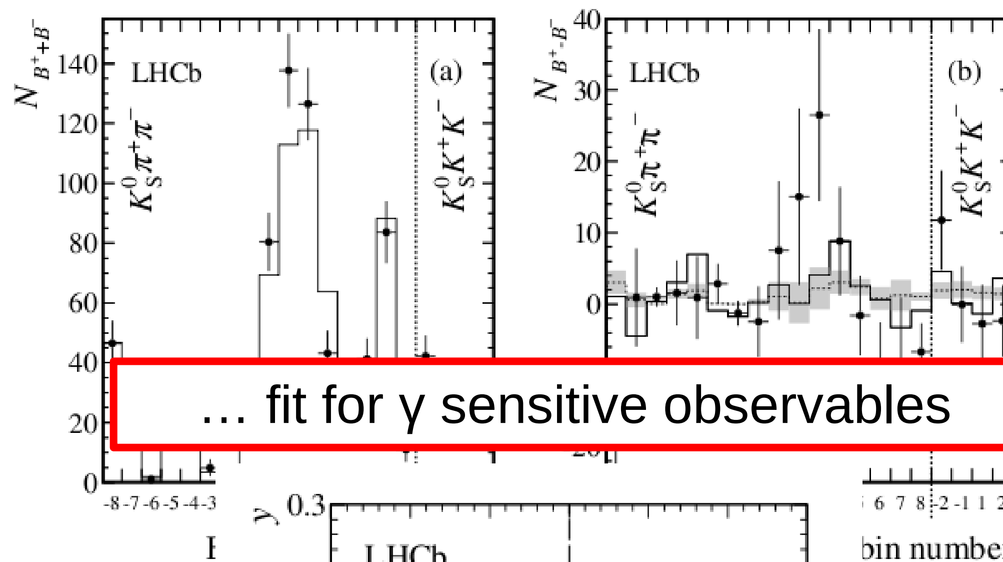
γ from $B^+ \to DK^+$, $D \to K^0_S h^+h^-$

LHCb (1/fb)
Phys. Lett. B 718 (2012) 43

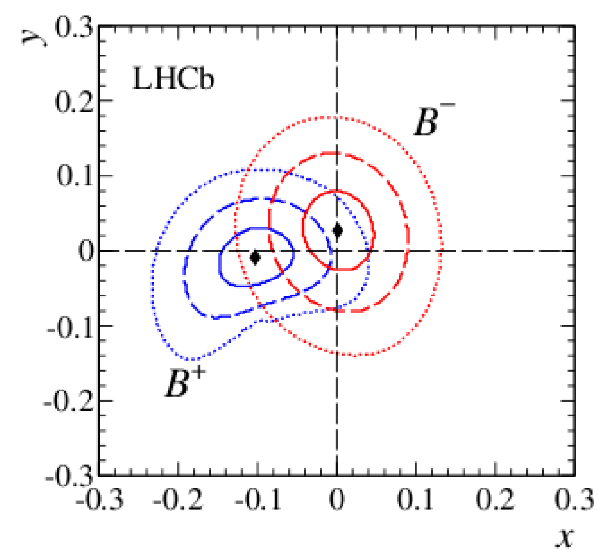
Reconstruct Dalitz plot distributions ...



… bin them ...
(in complicated but ~optimal way)



… fit for γ sensitive observables



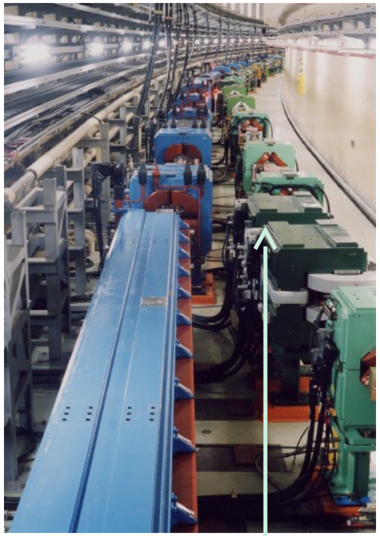
Upgrade – expected sensitivities

Type	Observable	Current precision	LHCb 2018	**Upgrade** ($50\,\mathrm{fb}^{-1}$)	Theory uncertainty
B_s^0 mixing	$2\beta_s$ ($B_s^0 \to J/\psi\ \phi$)	0.10 [9]	0.025	0.008	~ 0.003
	$2\beta_s$ ($B_s^0 \to J/\psi\ f_0(980)$)	0.17 [10]	0.045	0.014	~ 0.01
	$A_{\mathrm{fs}}(B_s^0)$	6.4×10^{-3} [18]	0.6×10^{-3}	0.2×10^{-3}	0.03×10^{-3}
Gluonic penguin	$2\beta_s^{\mathrm{eff}}(B_s^0 \to \phi\phi)$	–	0.17	0.03	0.02
	$2\beta_s^{\mathrm{eff}}(B_s^0 \to K^{*0}\bar{K}^{*0})$	–	0.13	0.02	< 0.02
	$2\beta^{\mathrm{eff}}(B^0 \to \phi K_S^0)$	0.17 [18]	0.30	0.05	0.02
Right-handed currents	$2\beta_s^{\mathrm{eff}}(B_s^0 \to \phi\gamma)$	–	0.09	0.02	< 0.01
	$\tau^{\mathrm{eff}}(B_s^0 \to \phi\gamma)/\tau_{B_s^0}$	–	5 %	1 %	0.2 %
Electroweak penguin	$S_3(B^0 \to K^{*0}\mu^+\mu^-; 1 < q^2 < 6\,\mathrm{GeV}^2/c^4)$	0.08 [14]	0.025	0.008	0.02
	$s_0\ A_{\mathrm{FB}}(B^0 \to K^{*0}\mu^+\mu^-)$	25 % [14]	6 %	2 %	7 %
	$A_{\mathrm{I}}(K\mu^+\mu^-; 1 < q^2 < 6\,\mathrm{GeV}^2/c^4)$	0.25 [15]	0.08	0.025	~ 0.02
	$\mathcal{B}(B^+ \to \pi^+\mu^+\mu^-)/\mathcal{B}(B^+ \to K^+\mu^+\mu^-)$	25 % [16]	8 %	2.5 %	$\sim 10\,\%$
Higgs penguin	$\mathcal{B}(B_s^0 \to \mu^+\mu^-)$	1.5×10^{-9} [2]	0.5×10^{-9}	0.15×10^{-9}	0.3×10^{-9}
	$\mathcal{B}(B^0 \to \mu^+\mu^-)/\mathcal{B}(B_s^0 \to \mu^+\mu^-)$	–	$\sim 100\,\%$	$\sim 35\,\%$	$\sim 5\,\%$
Unitarity triangle angles	γ ($B \to D^{(*)}K^{(*)}$)	~ 10–12° [19, 20]	4°	0.9°	negligible
	γ ($B_s^0 \to D_s K$)	–	11°	2.0°	negligible
	β ($B^0 \to J/\psi\ K_S^0$)	0.8° [18]	0.6°	0.2°	negligible
Charm *CP* violation	A_Γ	2.3×10^{-3} [18]	0.40×10^{-3}	0.07×10^{-3}	–
	ΔA_{CP}	2.1×10^{-3} [5]	0.65×10^{-3}	0.12×10^{-3}	–

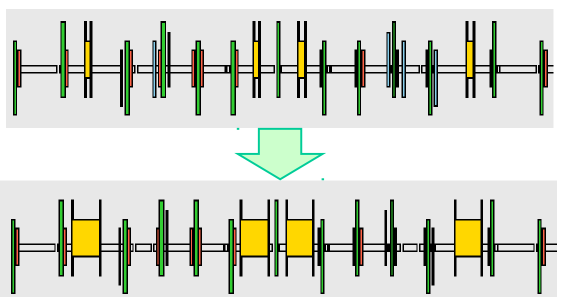
Table 1: Statistical sensitivities of the LHCb upgrade to key observables. For each observable the current sensitivity is compared to that which will be achieved by LHCb before the upgrade, and that which will be achieved with $50\,\mathrm{fb}^{-1}$ by the upgraded experiment. Systematic uncertainties are expected to be non-negligible for the most precisely measured quantities.

- sample sizes in most exclusive B and D final states far larger than those collected elsewhere
- no serious competition in study of B_s decays and CP violation

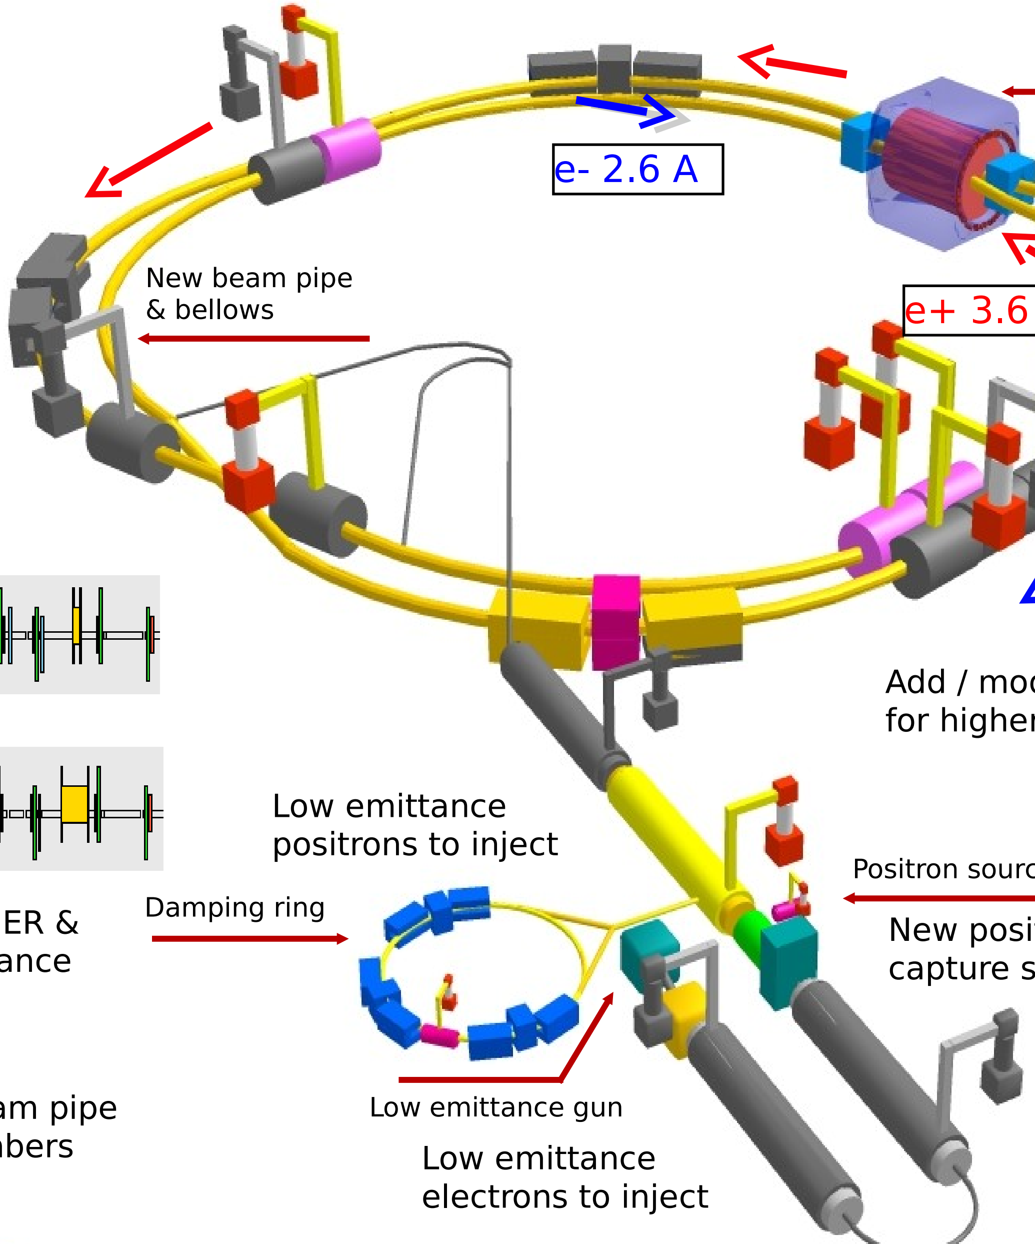
KEKB to SuperKEKB



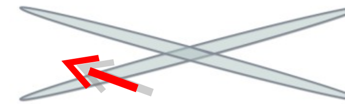
Replace short dipoles with longer ones (LER)



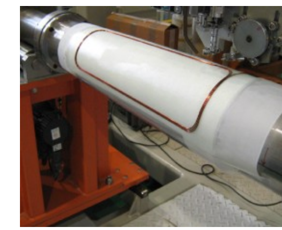
Redesign the lattices of HER & LER to squeeze the emittance



Colliding bunches

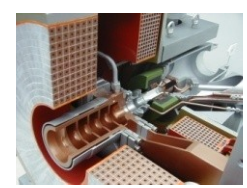


New superconducting /permanent final focusing quads near the IP

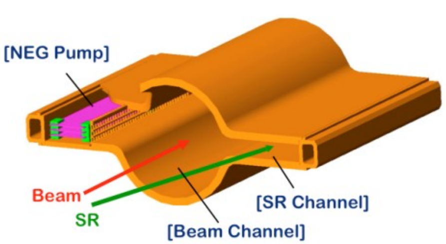


Add / modify RF systems for higher beam current

New positron target / capture section

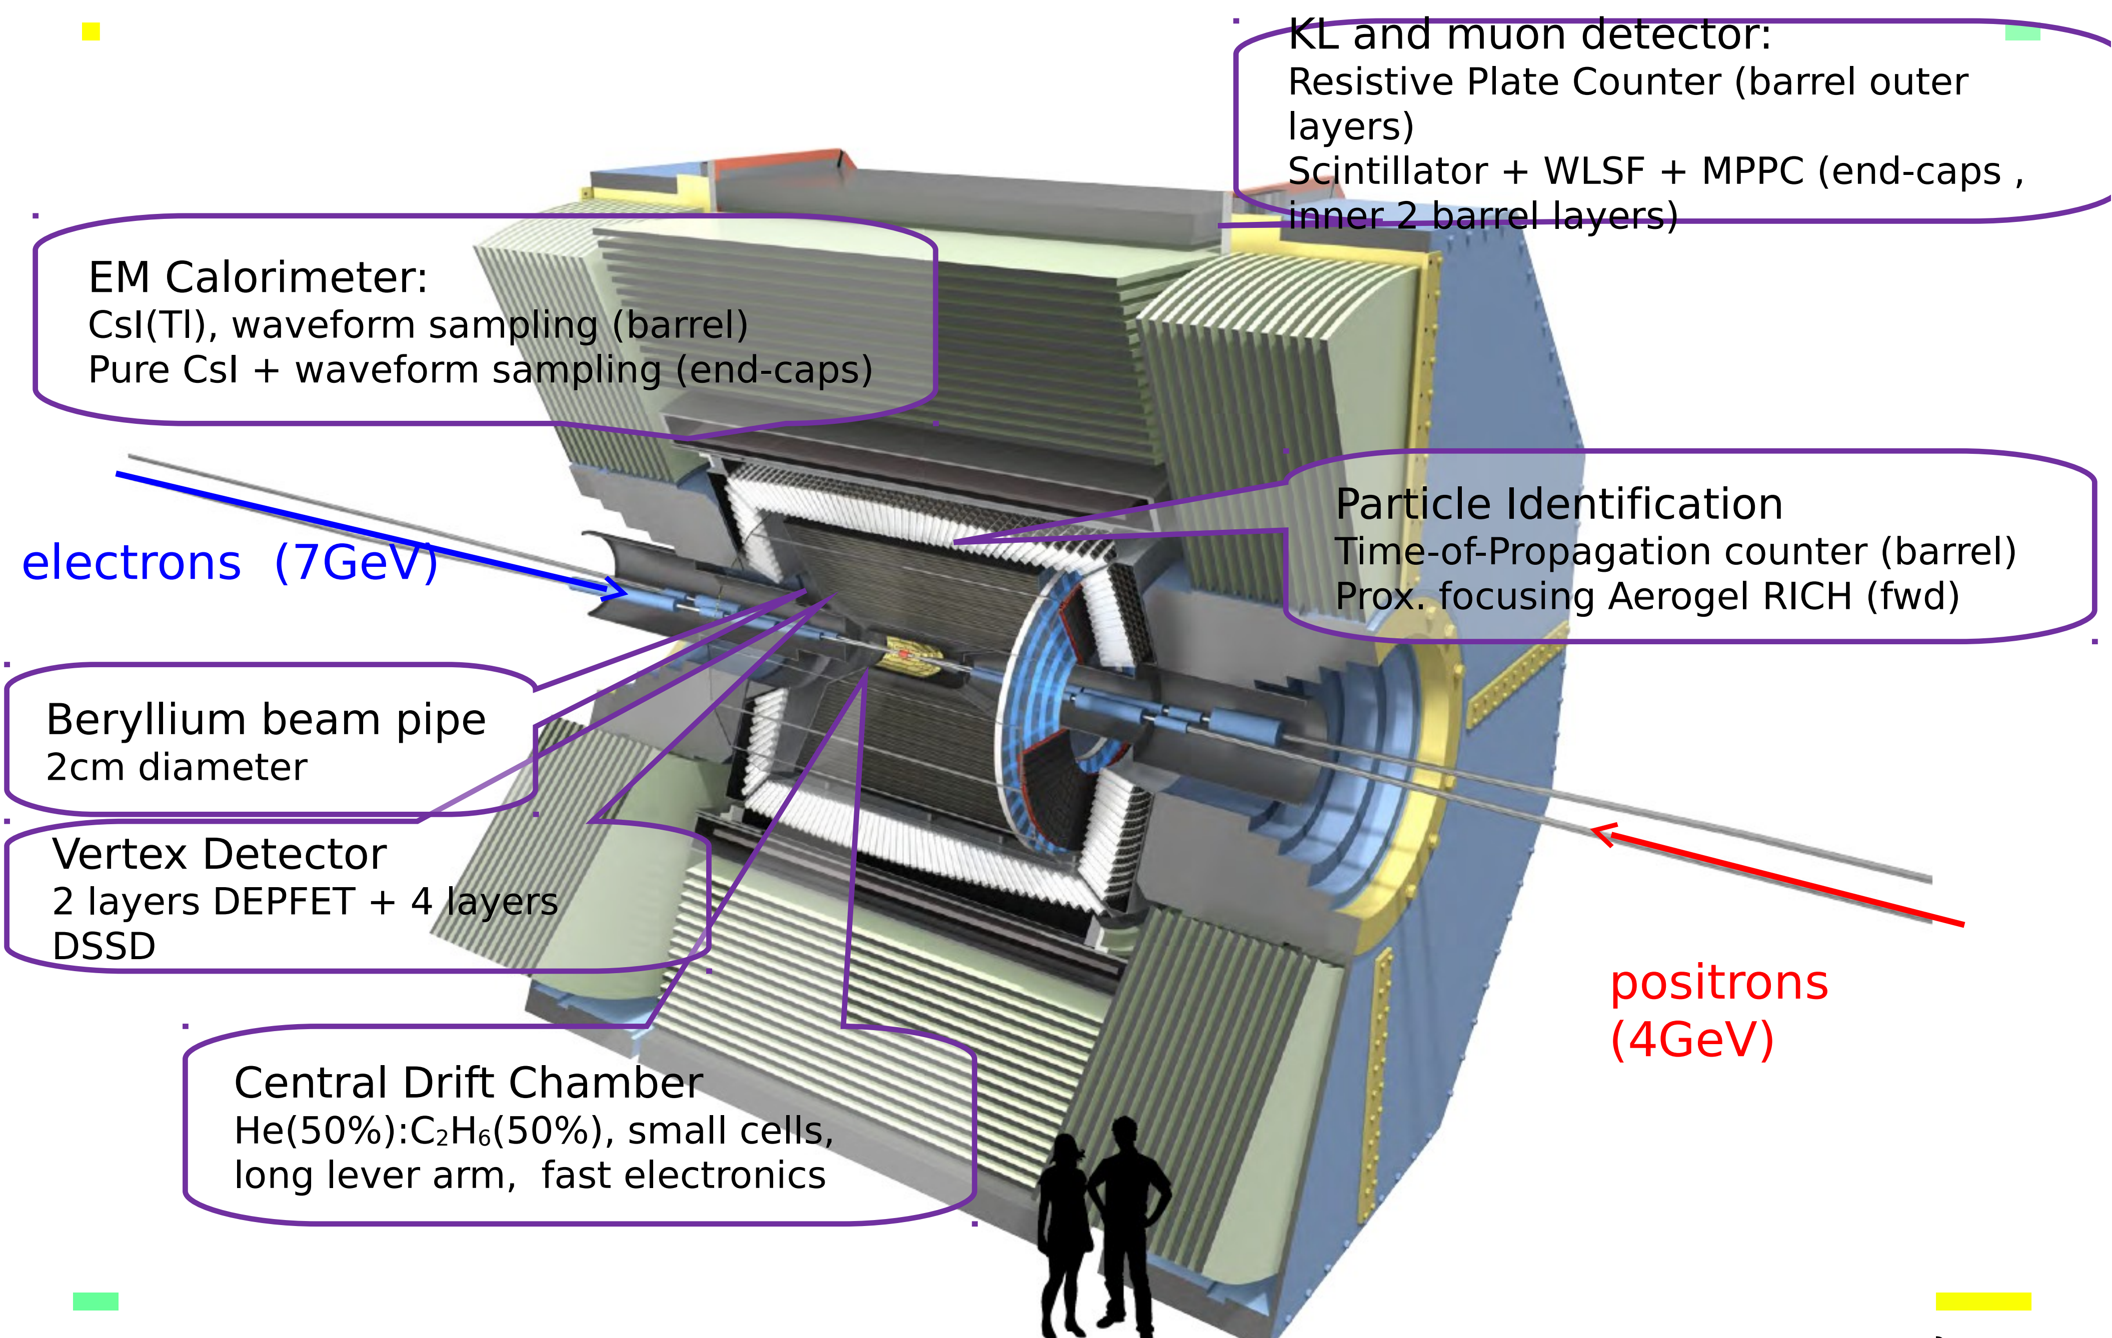


TiN-coated beam pipe with antechambers

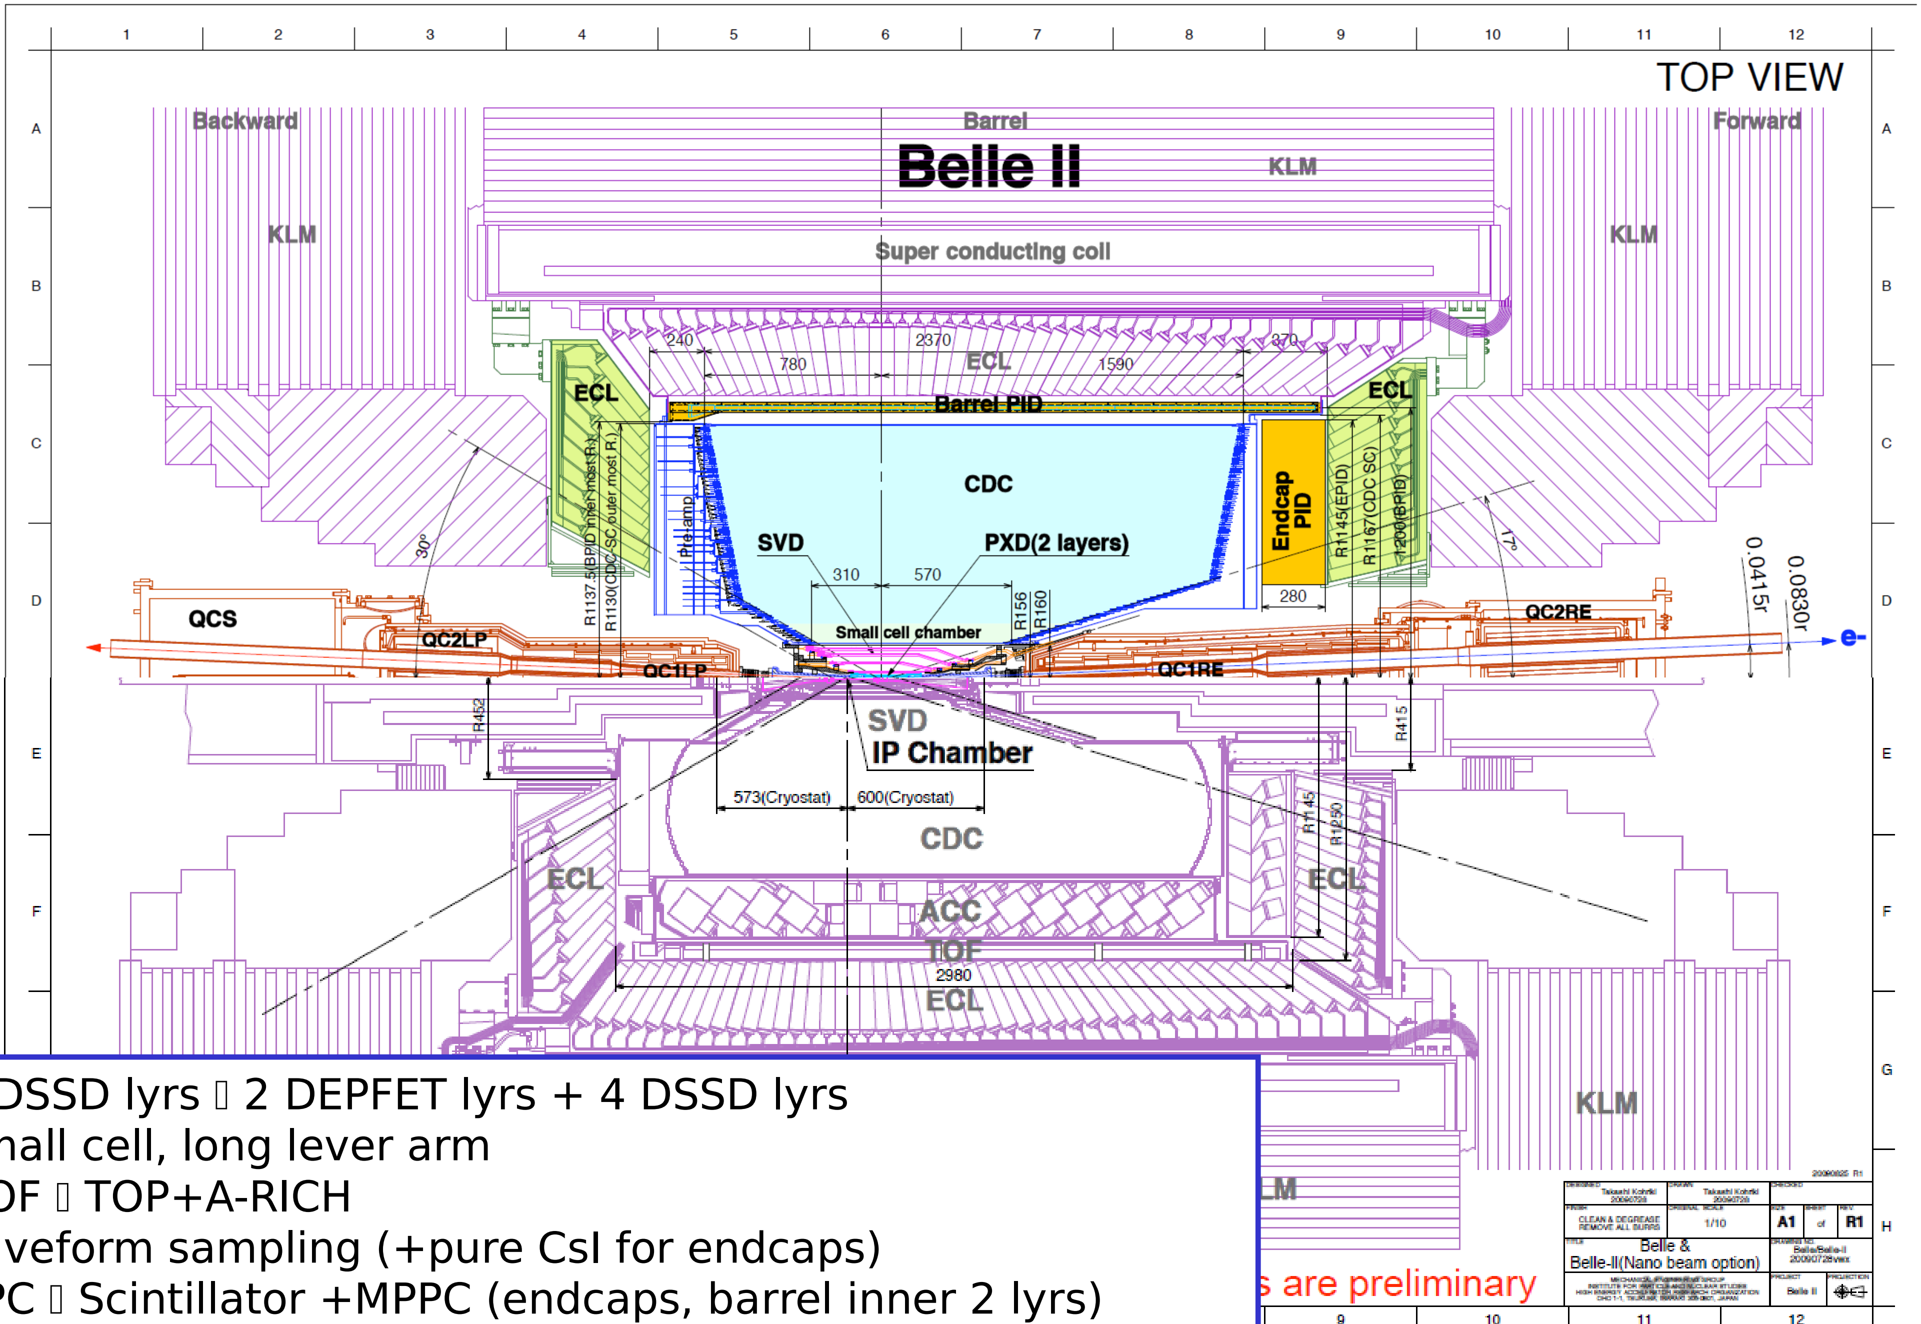


To obtain x40 higher luminosity

Belle II Detector

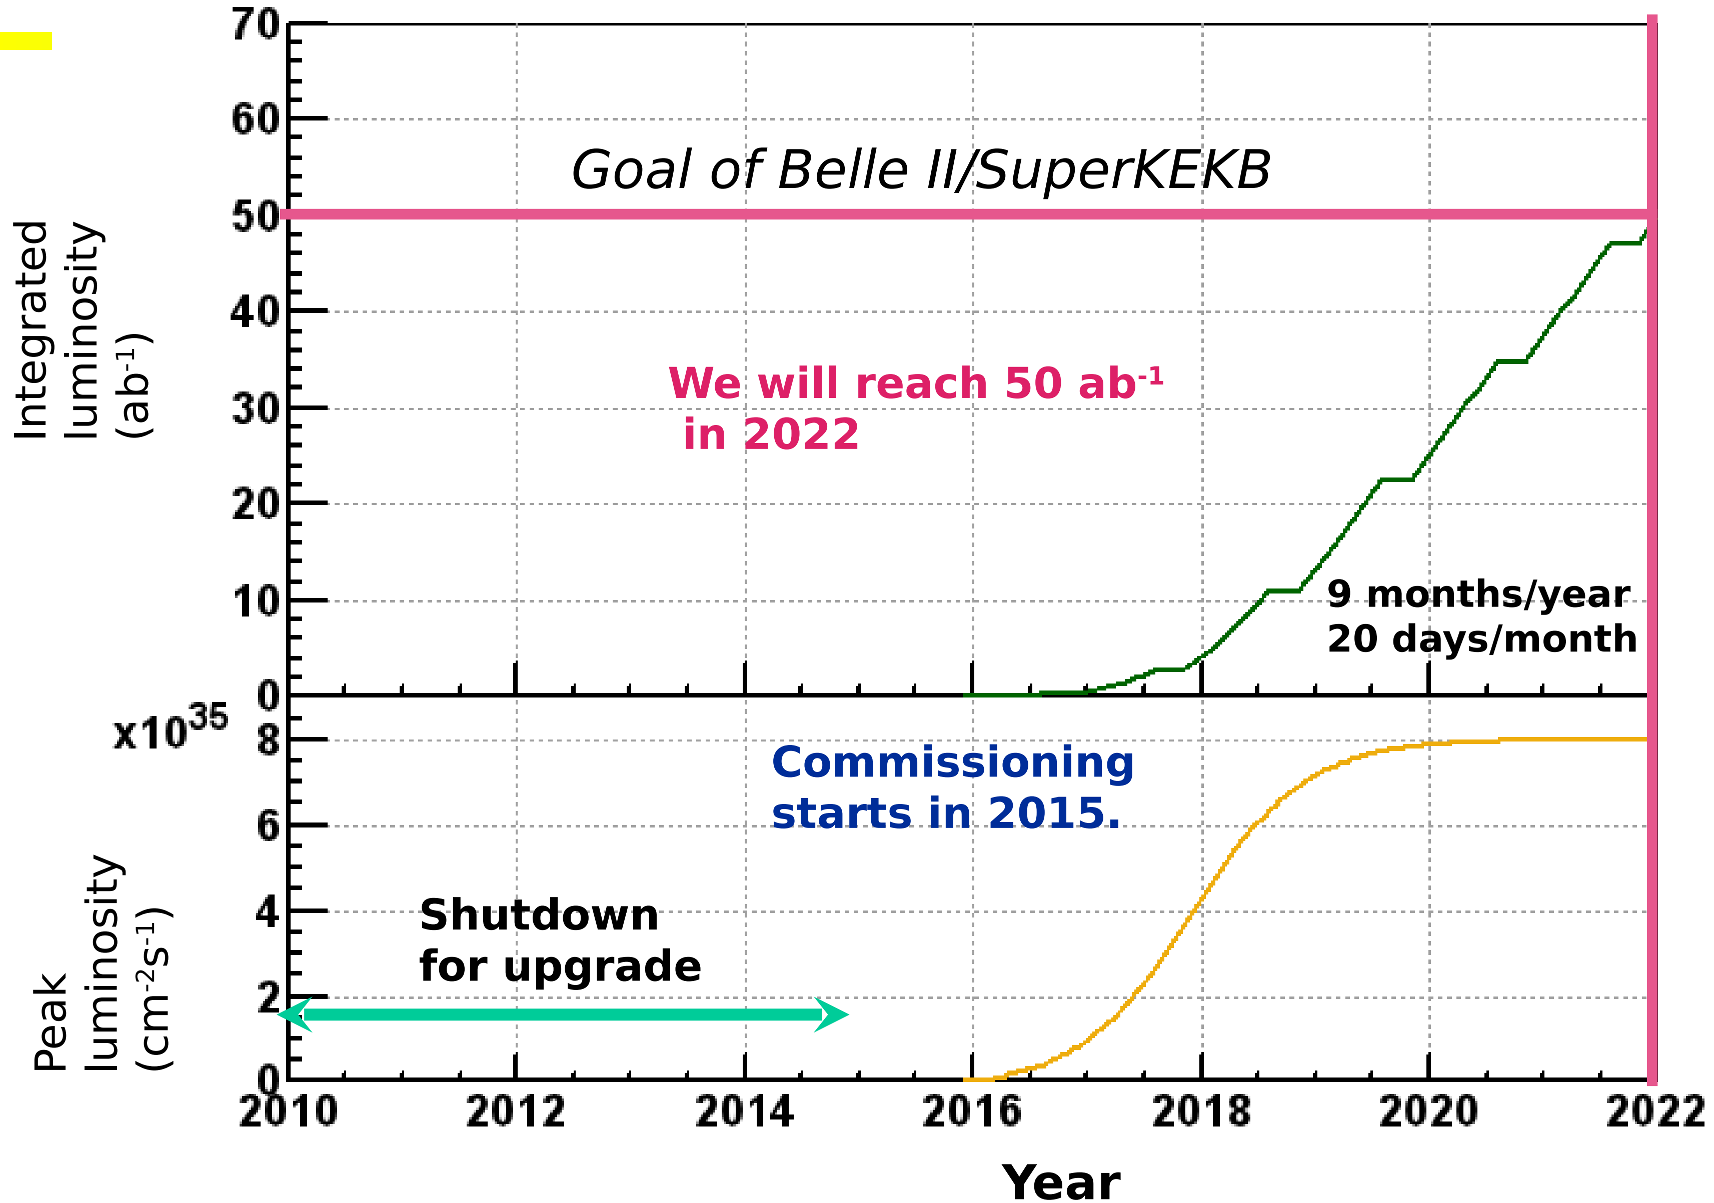


Belle II Detector (in comparison with Bell



D: 4 DSSD lyrs ▯ 2 DEPFET lyrs + 4 DSSD lyrs
C: small cell, long lever arm
C+TOF ▯ TOP+A-RICH
.: waveform sampling (+pure CsI for endcaps)
M: RPC ▯ Scintillator +MPPC (endcaps, barrel inner 2 lyrs)

Schedule



The schedule is likely to shift by a few months because of a new construction/commissioning strategy for the final quads.
